Comprehensive range of fire resistance products & solutions
The ROCKWOOL FIREPRO® range of products provides firestopping and fire resistance throughout the whole construction process; intended to make buildings and their inhabitants safer in the event of fire.

Beyond ROCKWOOL insulation’s inherent fire resistant qualities, our specialist range of products help architects, contractors and developers conform to current fire regulations.

Our range of fire resistance products cater for most general purpose and specialty building applications:

- Structural protection
- Penetration seals
- Joints
- Cavity barriers
- Heating, ventilation and air conditioning
- Process pipes.

50mm Ablative Coated Batt

Firestopping solution for voids in walls and floors

As part of the comprehensive FIREPRO® range of fire protection products, the ROCKWOOL Ablative Coated Batt is intended to act as an airseal barrier to reinstate the fire resistance and acoustic* performances of concrete floors, masonry walls and dry wall systems when voids have been created for the passage of services. This includes pipes made of plain or stainless steel, cast iron, copper, polypropylene (PP), high density polythene (HDPE), PVC and ABS along with all sheathed cables up to 80mm and supported cable bundles up to 100mm.

Ablative Coated Batts can also be used as a ‘head-of-wall’ barrier to extend the fire resistance and acoustic performances of drywall or masonry walls that finish at suspended ceiling height, up to the concrete soffit above. For use in concrete floors please contact the ROCKWOOL Technical Solutions team for size limitations.

In response to this growing and increasingly important market, ROCKWOOL has re-designed and tested the product to the dedicated fire resistance standard for penetration seals - EN 1366-3. Due to its specific nature, this document is intended to supersede the traditional BS 476: Parts 20 and 22 previously used for fire seal testing in the UK construction market.

The tests have proved the capability of a single 50mm Batt to provide up to 2 hours fire resistance integrity, insulation ratings are dependent upon the service penetration. Where 4 hour integrity and insulation are required we recommend the use of our 60mm insulation, as above. ensure the integrity of any vapour control membranes in your design.

Load-bearing seals

FIREPRO® Ablative Coated Batts are not intended for use as load-bearing seals. Where a load-bearing seal is required, ROCKWOOL Firestop Compound should be considered.

Fire performance

ROCKWOOL Ablative Coated Batt has been tested to the dedicated fire resistance standard for penetration seals - EN 1366-3. The independently prepared assessment, detailing the full scope of fire performance, is available from the ROCKWOOL Technical Solutions Team. Ablative Coated Batt fire resistance tests were conducted using ROCKWOOL Acoustic Intumescent Sealant sealant and/or ROCKWOOL.

Acoustic data

The correct use of Coated Batt within concealed cavities and voids will reduce the level of transmitted sound.

Load-bearing seals

FIREPRO® Ablative Coated Batts are not intended for use as load-bearing seals. Where a load-bearing seal is required, ROCKWOOL Firestop Compound should be considered.

Fire performance

ROCKWOOL Ablative Coated Batt has been tested to the dedicated fire resistance standard for penetration seals - EN 1366-3. The independently prepared assessment, detailing the full scope of fire performance, is available from the ROCKWOOL Technical Solutions Team. Ablative Coated Batt fire resistance tests were conducted using ROCKWOOL Acoustic Intumescent Sealant sealant and/or ROCKWOOL.

Acoustic data

The correct use of Coated Batt within concealed cavities and voids will reduce the level of transmitted sound:

- Rw= up to 48db (2 x Coated Batt)
- Rw= up to 37db (1 x Coated Batt)

Performance & properties

General benefits:
- Excellent fire resistance from single thickness Batt
- Standard size: 1200 x 600 x50mm
- Suitable for sealing wall and floor voids containing most commonly used services
- Can be used as a blank seal and a head of wall seal
- Lightweight and simple installation
- Maintenance free
- 160kg/m² density base material provides additional benefits of a smoke and acoustic seal
- Tested for air tightness

Installation

FIREPRO® Ablative Coated Batts are manufactured by spraying specially produced, high density ROCKWOOL insulation with an additional fire protection ablative coating. This is a fully automated process to ensure an even thickness of coating.

To install, the Batts are simply cut and a bead of Acoustic Intumescent Sealant applied around the external edges. They are then friction fitted between the services and the batt to create a fully continuous seal. Where butt joints are required between cut sections of adjacent batts, Acoustic Intumescent Sealant and/or FIREPRO® Glue is applied to both mating edges in order to form a fire tight bond between individual pieces of insulation. Contact the Technical Solutions team on 01656 862621 for specific details on blank seals and dampers.

All joints, including those around the perimeter of the Batt, are then pointed with FIREPRO® Acoustic Intumescent Sealant to complete the seal.

Plastic pipes (PVC, ABS and HDPE etc) must be sleeved with FIREPRO® Insulated Fire Sleeves at the point at which they pass through the Ablative Coated Batt. Similarly, to achieve fire resistance integrity (I) with metal pipes such as steel or copper, the pipes must be lagged with a combi sealant. The correct use of Coated Batt within concealed cavities and voids will reduce the level of transmitted sound:

- Rw= up to 52 db (2 x Coated Batt) - incorporating 48mm O/D PVC /15mm copper pipe penetrations.
- Rw= up to 34 db (1 x Coated Batt) - incorporating 48mm O/D PVC /15mm copper pipe penetrations.

Further acoustic test data is available for use in facefix applications. Contact the ROCKWOOL Technical Solutions Team.

Technical advice

For specific integrity and insulation ratings for the various services, please consult ROCKWOOL Standard Details, available via the ROCKWOOL Technical Solutions team.

* Please contact ROCKWOOL Technical Solutions for further details.
60mm Ablative Coated Batt

Firestopping solution for large voids in walls and floors

As part of the comprehensive FIREPRO® range of fire protection products, the ROCKWOOL Ablative Coated Batt is intended to act as an airseal barrier to reinstate the fire resistance and acoustic* performances of concrete floors, masonry walls and dry wall systems when voids have been created for the passage of services. This includes pipes made of plain or stainless steel, cast iron, copper, polypropylene (PP I, high density polythene (HDPE I), PVC and ABS along with ductwork and dampers and a wide range of cable types (both sheathed and un-sheathed, supported on both trays and ladders).

Ablative Coated Batt can also be used as a 'head–of–wall' barrier to extend the fire resistance and acoustic performances of masonry walls that finish at suspended ceiling height, up to the concrete soffit above. Voids of up to 20m in length and 1.2m in height can be sealed. In addition, blank seals of up to 7.02m** can be formed in either dry walls or masonry walls. For use in concrete floors please contact the ROCKWOOL technical solutions team for size limitations.

In response to this growing and increasingly important market, ROCKWOOL has re-designed and tested the product to the dedicated fire resistance standard for penetration seals - EN 1366–3. Due to its specific nature, this document is intended to supersede the traditional BS 476: Parts 20 and 22 previously used for fire seal testing in the UK construction market.

The tests have proved the capability of a single 60mm Batt to provide up to 4 hours fire resistance integrity and up to 2 hours insulation when used with all of the services listed above and also as a blank seal. Even for extreme requirements, where 4 hours integrity and insulation are required to maintain the performance of a masonry wall, a solution can also be accomplished with a double Batt solution.

General benefits:
- Excellent fire resistance from single thickness Batt
- Standard size: 1200 x 600 x 60mm
- Suitable for sealing large wall and floor voids containing most commonly used services
- Can be used as a blank seal and a head of wall seal
- Lightweight and simple installation
- Maintenance free
- 180kg/m³ density base material provides additional benefits of a smoke and acoustic seal
- Tested for air tightness

Load-bearing seals
FIREPRO® Ablative Coated Batt are not intended for use as load-bearing seals. Where a load-bearing seal is required, ROCKWOOL FireStop Compound should be considered.

Fire performance
ROCKWOOL Ablative Coated Batt has been tested to the dedicated fire resistance standard for penetration seals - EN 1366–3. The independently prepared assessment, detailing the full scope of fire performance, is available from the ROCKWOOL Technical Solutions Team. Ablative Coated Batt fire resistance tests were conducted using ROCKWOOL Acoustic Intumescent Sealant Sealant and/or ROCKWOOL FIREPRO® Glue.

Performance & properties

Acoustic Intumescent Sealant

Fire & Acoustic Intumescent Sealant for thin linear joints

As part of the comprehensive FIREPRO® range of fire protection products, ROCKWOOL Acoustic Intumescent Sealant is suitable for sealing joints and service penetrations in fire walls, partitions, fire rated door frames and glazing systems. Tested to BS476 Part 20, ROCKWOOL Acoustic Intumescent Sealant provides up to 4 hours fire protection in joints of up to 30mm width.

Acoustic Intumescent Sealant is available in 310ml cartridges, 600ml foil sausage packs or 5 litre tubs.

In addition to the fire rating the sealant may be used to seal joints in party walls to provide an acoustic seal.

**Description**

Acoustic Intumescent Sealant is a high specification, one part water based acrylic sealant. The sealant is extruded from a 310ml loaded cartridge into a standard sealant gun or a 600ml sausage loaded into a closed barrel sealant gun. The depth of the joint will depend on the gap to be filled and the fire rating required (see Tables 1 and 2).

**Application**

All surfaces must be thoroughly clean and free of bond breaking contaminants prior to application of the sealant. No priming is required for most commercial substrates, however it is recommended that before installation the sealant is applied to a small area of the substrate to assess adhesion.

The sealant should not be applied if the ambient temperature is below 5°C as adhesion may be impaired.

The sealant is fast curing, approximately 15 minute tack free time. When fully cured the sealant can be overpainted.

Colours

Available as standard in White. Other colours are available for order, subject to relevant M.O.Q. Please contact ROCKWOOL Technical Solutions Team for further assistance.

**Standards & approvals**

Acoustic Intumescent Sealant has been tested and assessed to BS 476 Part 20 and is third party approved by the Loss Prevention Certification Board for performance and quality – Red Book certification no. 822b (AI). Certificates can be accessed online at www.rockwool.co.uk and www.redbooklive.com

**Specification**

Install ROCKWOOL Acoustic Intumescent Sealant to provide up to 4 hours fire protection in all joints up to 30mm in all firewalls. Installation to be fully in accordance with manufacturer’s instructions.

Building Regulations 2000 – Approved Document B – B2/3/4

- Internal fire spread (structure), paragraphs 0.10 – 0.11, state that the spread of fire inside a building can be restricted, by provisions for elements of structure to have a specified minimum period of fire resistance. Fire resistance is defined in terms of both integrity and insulation.

Fire Barrier Systems
Inhibiting the spread of fire & smoke in concealed spaces

As part of the comprehensive FIREPRO® range of products, ROCKWOOL Fire Barrier systems offer labour-saving solutions to prevent fire and smoke spread within roof and ceiling voids for all general labour-saving solutions to prevent fire and smoke products, ROCKWOOL Fire Barrier systems offer capable of maintaining its performance in void heights extended drops are easily catered for, with the system capable of maintaining its performance in void heights up to 10.5 metres – refer to sections on extended drops for further guidance.

Description
ROCKWOOL Fire Barrier has a 25mm galvanised wire mesh stitched with wire, to one face, to produce a flexible Fire Barrier with optional aluminium foil faces. ROCKWOOL Fire Barrier Slab has a factory applied foil finish to both faces.

ROCKWOOL Fire Barrier and Fire Barrier Slab achieve a reaction to fire classification of A1 as defined in BS EN 13501:1. ROCKWOOL Fire Barrier systems have been developed to inhibit the spread of flames, heat and smoke through concealed spaces in buildings and improve sound reduction. The fixing solutions described in this data sheet have been designed to simplify detailing and incorporate, where possible, commonly available building fasteners and components. ROCKWOOL Fire barrier Slab dimensions 1000mm x 666mm x 100mm

Applications & design
ROCKWOOL Fire Barrier solutions can be applied as a hanging curtain or as a friction fitted slab. The barrier is continuously supported and secured to the soffit by its head. At the base, it is preferable in a cavity barrier situation to wire the barrier to the ceiling grid although it is acceptable to let it drape freely, turned back across the ceiling (see Fig 13).

If the Fire Barrier is to form a continuation within a void of a fire resistant wall/partition, it is essential to fix the barrier to the wall/partition head to maintain integrity.

Regulations, standards and product approvals
Compartmentation: ROCKWOOL Fire Barriers and Fire Barrier Slabs are able to meet the fire requirements of Building Regulations applicable to all parts of the UK and Ireland where fire resistant (compartment) walls need to be continued above a ceiling into the roof void, for all periods up to 2 hours and 1 hour respectively. Concealed spaces (cavities): Similarly ROCKWOOL Fire Barriers and Fire Barrier Slabs satisfy the specific requirements for divisions of space within concealed cavities (Cavity Barriers) as defined in Building Regulations, intended to restrict the passage of smoke and flames through extended roof voids.

Certification: Fire Barrier Systems have been independently tested and assessed to BS 476. Part 22 by accredited laboratories. They are third party approved for performance and quality by the Loss Prevention Council Certification board (LPCB) and are listed in their Fire and Security ‘Red Book’ certificate no. 022c. Certificates can be accessed online at www.rockwool.co.uk or www.redbooklive.com

The product has been authorised for use in LUL surface and sub-surface premises when installed in accordance with this data sheet – please refer to the LUL Approved Product Register website www.LU-apr.uk for specific details.

Acoustic performance
The correct use of Fire Barrier within structural cavities and voids will reduce the level of transmitted sound.

SoundPro range of acoustic solutions
Fire Barrier Systems are part of the ROCKWOOL SoundPro range of acoustic solutions.
½ hour Cavity Barrier – typical fixing methods

Figures 4-8 show typical details for Fire Barrier applied to a timber truss construction as a half hour cavity barrier within the roof section, to satisfy the requirements of Building Regulation B3 – 14) i.e. 30 minutes fire integrity and 15 minutes fire insulation.

If the truss is constructed from a minimum timber size of 35 to 49mm thick, both sides of all truss members/bracing require protection from fire in order to minimise charring and retain strength. Figure 6 shows strips of 50mm Fire Barrier used on the reverse side of the truss for this purpose. Nail plate fixings may fail prematurely in fire unless protected (see Fig 9).

The new ROCKWOOL fixing system incorporates an angle support and clamping plate.

For fixing to timber, the ROCKWOOL clamping plate is used, compressing the barrier to the timber, fixed at 450mm centres using No. 10 woodscrews. For fixing to concrete soffits, the pre-punched angle support is fixed using Hilti DBZ or Ejot ECL 35 hammer set anchors at max. 750mm centres.

To use the patented ROCKWOOL angle support system, bond tongues out to 90° and impale barrier onto them. The slotted clamping plate is then fitted by pushing the tongues through the slots, these are then bent over the face of the clamping plate completing the process.

ROCKWOOL Angle Support. The tongue has two positions for bending.

ROCKWOOL Clamping Plate

Figures 21-22: Figure 22 shows the 50mm Fire Barrier single and double layers, extended drops and overlapped joints as per Figure 17. For additional guidance and drops in excess of 6m, please refer to figure 31 and associated guidance.

60–30 Fire Barrier

If 30 minutes insulation is required, use 1 layer of 40mm plain or foil faced fire barrier with 100mm vertical overlapped joints (Fig 16). The barrier is otherwise fixed for timber construction as previously shown on page 14.

Common details

Extended drops

ROCKWOOL 50mm Fire Barrier single and double layers, can be extended from a 3.5m drop to a maximum 6m drop by fixing an additional 2.5m section, stitched with overlapped joints as per Figure 17. For additional guidance and drops in excess of 6m, please refer to figure 31 and associated guidance.

Wire stitching of butt joints in ROCKWOOL Fire Barriers

Adjacent barriers must be closely butt jointed, or overlapped, and through stitched with 0.9mm galvanised annealed wire. It is essential that the barrier provides a good seal at its head, perimeter and at all joints. Where the barrier abuts a profile such as a trapezoidal deck, the material must be cut to suit and secured to fire stop the gap (see Fig 13). For extended drops, 1.5mm diameter galvanised and annealed wire is used (see Fig 17).

Allow sufficient material to pack and stitch Fire Barrier between rafters as shown.

Figure 7 Head of partition

Figure 8 Barrier fitted transversely to timber joisted ceiling

Figure 9 Half hour protection for timber truss construction 50mm thick or more. Note: Nail plate protection required – see Figure 6

Figure 10 50mm Fire Barrier fixed to concrete soffit

60mm Fire Barrier

If 60 minutes insulation is required, use 2 layers of 30mm plain or foil faced fire barrier with 100mm vertical overlapped joints (Fig 17). The barrier is otherwise fixed for timber construction as previously shown on page 14.

Common details

Extended drops

ROCKWOOL 30mm Fire Barrier single and double layers, can be extended from a 3.5m drop to maximum 6m drop by fixing an additional 2.5m section, stitched with overlapped joints as per Figure 17. For additional guidance and drops in excess of 6m, please refer to figure 31 and associated guidance.

Wire stitching of butt joints in ROCKWOOL Fire Barriers

Adjacent barriers must be closely butt jointed, or overlapped, and through stitched with 0.9mm galvanised annealed wire. It is essential that the barrier provides a good seal at its head, perimeter and at all joints. Where the barrier abuts a profile such as a trapezoidal deck, the material must be cut to suit and secured to fire stop the gap (see Fig 17). For extended drops, 1.5mm diameter galvanised and annealed wire is used (see Fig 17).

Allow sufficient material to pack and stitch Fire Barrier between rafters as shown.

Figure 15 50mm Fire Barrier with overlap joints to obtain 60 min integrity 30 mins insulation

Figure 16 60mm Fire Barrier cut and pushed up into profile as fire stopping
Penetration details

It is regarded as good practice to adequately support or reinforce services penetrating compartment walls and cavity barriers, to prevent displacement. It is recommended that such supports should be no greater than 500mm from each face of the Fire Barrier.

To maintain the integrity of the Fire/Cavity Barrier when penetrated by services with a high melting point (such as steel or copper pipes, beams or trusses) the barrier is first cut locally to accommodate the service or structural member and then re-stitched as neatly as possible. The penetration is then tightly sleeved each side of the barrier to a minimum length of 300mm, using the same barrier material. Each sleeve should be securely stitched to the main barrier to produce a tight seal and prevent future detachment (see figures 18 and 19).

If the penetrating service is manufactured from low melting point materials such as plastic or aluminium, then sleeving should be extended to at least 1000mm either side of the barrier.

Figure 15

For protected steel ductwork with a tested fire performance (stability, integrity and insulation) at least the same as the Fire Barrier, 300mm sleeves should be applied either side of the main barrier, as for high melting point services above.

For information on achieving fire protection to steel ductwork, please refer to the ROCKWOOL Fire Duct System data sheet.

Penetration of Fire Barrier by pipework and ductwork. Length of Figure 18

This guidance applies to services such as pipes, sheathed cables and conduits, including those carried on steel trays. For non-fire protected ductwork, or that with a fire resistance performance less than the barrier, two sleeves should be applied to each side of the barrier. An inner sleeve of 1000mm and an outer sleeve of 300mm. All sleeves should be stitched to the main barrier.

The duct should also include an independently supported fire damper, located in the line of the main barrier. Reference should also be made to Approved Document B of England & Wales Building Regulations – Volume 1, Requirement B3, Section 7 and Volume 2, Requirements B3, Section 10.

For non-fire protected ductwork, or that with a fire resistance performance less than the barrier, two sleeves should be applied to each side of the barrier. An inner sleeve of 1000mm and an outer sleeve of 300mm. All sleeves should be stitched to the main barrier. The penetration is then tightly sleeved each side of the barrier to a minimum length of 300mm, using the same barrier material. Each sleeve should be securely stitched to the main barrier to produce a tight seal and prevent future detachment (see figures 18 and 19).

If the penetrating service is manufactured from low melting point materials such as plastic or aluminium, then sleeving should be extended to at least 1000mm either side of the barrier.

Figure 15

For protected steel ductwork with a tested fire performance (stability, integrity and insulation) at least the same as the Fire Barrier, 300mm sleeves should be applied either side of the main barrier, as for high melting point services above.

For information on achieving fire protection to steel ductwork, please refer to the ROCKWOOL Fire Duct System data sheet.

For protected steel ductwork with a tested fire resistance performance (stability, integrity and insulation) at least the same as the Fire Barrier, 300mm sleeves should be applied either side of the main barrier, as for high melting point services above.
1½ hour and 2 hour Fire Barrier – typical fixing methods

1½ hour Fire Barrier
The ROCKWOOL 1½ hour Fire Barrier system uses 2 layers of 50mm fire barrier with staggered joints fixed as Fig. 25–27. Please note: Wire reinforced faces should be placed outwards.

2 hour Fire Barrier
The ROCKWOOL 2 hour Fire Barrier consists of two layers of 60mm (plain or foil-faced), wire stitched Fire Barrier with staggered vertical joints, separated by a nominal 40mm air space. The base or perimeter to which the barrier is fixed must be capable of remaining in place for 2 hours.

Angle and strap for 1½ and 2 hour Fire Barriers
The following specification for slotted angles and straps is suitable for supporting ROCKWOOL Fire Barriers for 1½ and 2 hours when tested to BS 476: Part 22. Slotted angles (62 x 41 x 2mm) and straps (38 x 2mm) manufactured from mild steel conforming to BS 1449: Part 1.1: 1991 and cold reduced to provide a minimum of 0.2% proof stress of 417 Mpa (27 tons/in²) and conforming to BS 4345: 1968 (1986) – Specification for slotted angles (inc. flat strap).

Durability
For durability, we recommend that the finish should be capable of withstanding at least 200 hours salt spray and 400 hours humidity corrosion resistance testing to BS 3990. Part F. Slotted angles and straps conforming to this specification are available from the following suppliers:
- JB Products tel: 01384 240234
- Link 51 tel: 01952 682251
- Romstor tel: 01442 242261
If other hardware is used to support the barriers, we recommend that the respective specifier, supplier or installer should be certain that the chosen fixing system has been both tested and approved, for the required period of fire resistance and drop height.

Site advisory service
ROCKWOOL provides a site advisory service by engineers, solely employed to assist with advice when installing ROCKWOOL materials on site. The service is intended for site guidance, but is not intended to be an inspection facility unless agreed under a separately financed contract agreement.

For approval of installed barriers, the installer or building owner will be referred to a suitably accredited and experienced fire assessor or fire safety engineering organisation.
Fire Barrier Slab

Fire Barrier Slab offers a new solution to this typical application for up to 4 hours integrity. ROCKWOOL Fire Barrier Slab is an aluminium foil faced slab used to close voids of up to 1m in height and 20m in length supported by a masonry wall (minimum density of 400 kg/m³) offering the same fire performance.

The slabs are cut to height and friction fitted within the opening. ROCKWOOL Acoustic Intumescent Sealant or ROCKWOOL LUL Intumescent Sealant is applied to the butt joints and perimeter of the barriers.

Service penetrations

The ROCKWOOL Fire Barrier Slab can be penetrated by steel pipes of up to 33mm external diameter or smaller, and steel cable trays of 305 x 50mm or smaller.

These penetrating services must be independently supported a maximum of 150mm from the face of the slabs. ROCKWOOL Acoustic Intumescent Sealant or ROCKWOOL LUL Intumescent Sealant is applied to the butt joints and perimeter of the barriers. See Figure 30.

Fire performance of ROCKWOOL Fire Barrier Slab

ROCKWOOL Intumescent Sealants

All joints are closed using ROCKWOOL Acoustic Intumescent Sealant or ROCKWOOL LUL Intumescent Sealant to ensure a tight fit during a fire situation.

Flammability

When subjected to flame, ROCKWOOL Intumescent Sealants will expand and char, blocking the passage of smoke and flame (see Fig 33). In sensitive areas, such as underground tunnels where smoke evolution could be a potential problem, use ROCKWOOL LUL Sealant.

Service temperature range

-20°C to +70°C

Coverage

Based on a 9mm x 6mm joint. ROCKWOOL Intumescent Sealants will cover approximately 5.5 linear metres. Intumescent Sealants must be applied with a minimum width of 4mm and a maximum width of 20mm.

The Intumescent Sealants will allow for 10% compression and tension movement in a butt joint. Both varieties of ROCKWOOL Intumescent Sealants are supplied in 310ml cartridges, 25 cartridges per box.

Packaging of Fire Barrier Slabs

Two slabs per pack enclosed in polythene.

* Horizontal overlapped joint required (see fig.14)

Access through barriers

Where regular access is required through the barriers for maintenance purposes etc, this should be achieved by the inclusion of an independently supported fire rated door set and frame. The Fire Barriers should be clamped to the door frame with the SW clamping plate and appropriate fixings at 450mm centres.

Work on site

Handling and storage

ROCKWOOL Fire Barriers are easy to handle. It is easy to cut to any shape. The product should be stored indoors or under a weatherproof covering.

Maintenance

Once installed ROCKWOOL Fire Barriers should need no maintenance. Fire Barriers should be inspected to ensure that they have not been disturbed during maintenance of areas and/or as part of a regular maintenance program.

Further details are available from ROCKWOOL Technical Solutions Team.

Fire barriers and dampers

Where ROCKWOOL Fire Barriers are installed in conjunction with fire dampers, the dampers must be supported independently of the fire barrier. HVAC or ASFP publications may be helpful.

Figure 32 One hour Fire Barrier Slab – general view

The product has been authorised for use in LUL surface and sub-surface premises when installed in accordance with this data sheet – please refer to the LUL Approved Product Register website www.LUL-apr.uk for specific details.
Firestop Compound
Firestop solution for cable pipe and duct penetrations

As part of the comprehensive FIREPRO® range of fire protection products, ROCKWOOL Firestop Compound is used to provide a fire resisting seal around service penetrations in fire rated walls and floors. Tested to BS476 Part 20, 1987, Firestop Compound provides up to 6 hours fire protection.

CONSTRUCTION TYPE
penetration void fillers
FIreSTOPPING

General benefits:
- Smoke seal
- Good acoustic barrier
- Suitable for making good around most types of service penetrations
- Load bearing (see load bearing table for details)
- Simple installation
- No smoke emission
- Maintenance free
- Unaffected by humidity
- Available within 48 hours of order

Performance & properties

Installation instructions
In floors, a permanent shuttering made from 50mm ROCKWOOL slab [minimum density 140kg/m³] is cut and friction fitted between services and the edges of the floor slab. Firestop Compound is then trowelled over the shutter to a depth of 25mm thick. This is allowed to cure. Further Firestop Compound is then mixed to a pouring grade and tops the seal up to the required depth.

Floor Openings Pouring:
1) A bag of compound to 10 litres water (3:1) by volume. Vary to suit site conditions.
2) Set the shuttering into the opening ensuring a tight fit so that once the required depth of Compound is installed it finishes flush with the floor slab/screed unless otherwise specified.
3) Mix and pour compound until the required thickness is achieved.

Reinforcement
Reinforcing of the compound requires either 12mm diameter bars or 40mm (high)x 60mm steel angle fixed across the short span of the aperture. The bars should be installed at 200mm centres across the aperture and may be installed such that they are recessed into the surrounding structure by minimum 50mm on both sides or supported on an steel angle securely fixed to the structure. Steel angle reinforcement shall be installed at 250mm centres and shall be bolted back to supporting angle, which is fixed back to the structure. The support angle for rod or angle reinforcement shall be 50mm x 50mm x 1.6mm and shall be securely fixed back to the structure with nominally 8mm steel anchor bolts at a maximum of 200mm centres. In all instances the reinforcement shall be positioned approximately 30mm above the bottom surface of the compound to ensure adequate fire protection from below. Existing compound installations can be easily drilled or sawn to allow the provision of additional or replacement services and subsequently re-sealed. Recommended minimum clearance between services and surrounding structure – 50mm or half the diameter, whichever is greater.

Wall openings
In walls, Firestop Compound is mixed into a stiff consistency for trowelling into openings."

Trowelling
1) A bag of compound to 10 litres water (3:1) by volume. Vary to suit site conditions.
2) Apply compound as specified (see sketches a, b, c).
3) Trowel the compound, starting at the base of the opening ensuring the correct thickness is achieved.

Figure 1
Firestop Compound poured onto permanent stonewool fibre shutter in floor

Figure 2
Firestop Compound sets in 30-45 minutes and is capable of accommodating light foot traffic in approximately 72 hours.

* Plastic pipework must be protected with either ROCKWOOL Firestop Pipe Collars or Intumescent Pipe Wraps. (See separate product information)

The product has been authorised for use in LUL surface and sub-surface premises when installed in accordance with this data sheet - please refer to the LUL Approved Product Register website www.LU-apr.uk for specific details.
Performance in walls and floors

Firestop Compound has been independently tested for use in walls and floors.

When reinforced, Firestop Compound offers up to 360mins* protection for both Integrity and Insulation in masonry/ concrete walls or concrete floors.

When un-reinforced, Firestop Compound offers up to 240mins* protection for both Integrity and Insulation in masonry/ concrete walls or concrete floors.

This is general guidance. Advice from ROCKWOOL Technical Services should always be obtained.
Firestop Pipe Collars

Firestop solution for plastic pipework penetrations

As part of the comprehensive FIREPRO® range of fire protection products, ROCKWOOL Firestop Pipe Collars provide a simple and effective method of firestopping plastic pipework where it passes through fire resistant walls and floors in a retrofit situation.

Tested to BS476 Part 20, Firestop Pipe Collars provides up to 4 hours fire protection.

General benefits:
- Simple to install
- Water resistant
- Maintenance free
- Available to suit pipe sizes ranging from 55 to 355mm O.D.
- Available from order in 48 hours

Tested to BS476 Part 20, Firestop Pipe Collars provides up to 4 hours fire protection.

Installation in walls
1) Make good wall around plastic pipe with either ROCKWOOL Acoustic Intumescent Sealant or Firestop Compound.
2) Undo the toggle clip on the Firestop Pipe Collar and open it out.
3) Slide the Firestop Pipe Collar, with its fixing tabs pointing towards the face of the wall, around the plastic pipe.
4) Lock the Firestop Pipe Collar around the pipe closing the toggle clip. Push the Firestop Pipe Collar back on to the wall.
5) Fix the Firestop Pipe Collar to the wall by means of 32mm long steel self-tapping screws, through the fixing tabs.
6) Repeat for the other side of the wall if required.

Installation in floors
1) Make good floor around plastic pipe with either ROCKWOOL Acoustic Intumescent Sealant or Firestop Compound.
2) Undo the toggle clip on the Firestop Pipe Collar and open it out.
3) Slide the Firestop Pipe Collar, with its fixing tabs pointing up towards the face of the soffit, around the plastic pipe.
4) Lock the Firestop Pipe Collar around the pipe closing the toggle clip. Push the Firestop Pipe Collar back on to the soffit.
5) Fix the Firestop Pipe Collar to the soffit by means of 32mm long steel self-tapping screws, through the fixing tabs

Specification
Install ROCKWOOL Firestop Pipe Collars to provide up to 1, 2, 3 or 4 hours fire protection to all plastic pipework, in accordance with manufacturer’s instructions.

The product has been authorised for use in LUL surface and sub-surface premises when installed in accordance with this data sheet – please refer to the LUL Approved Product Register website www.LU-apr.uk for specific details.
**Description, performance & properties**

**Description**

Firestop Pipe Collars consist of a corrosion resistant power coated steel sleeve, containing a flexible graphite based intumescent liner manufactured to suit the pipework to be firestopped. Integral toggles are opened up and the collar is simply fitted around the plastic pipe. The toggles are closed and the collar is pushed flush to the surface of the wall or underside of floor. The collar is then securely fastened to the structure by means of fire resistant fixings threaded through fixing tabs.

Any gaps of up to 25mm wide around the pipework should be filled with ROCKWOOL Acoustic Intumescent Sealant. For gaps greater than 25mm wide ROCKWOOL Firestop Compound can be used. Under fire conditions the intumescent material swells filling the void left by the burnt out plastic.

**Fire Resistant Silicone Sealant**

A high performance firestopping sealant

**Description**

ROCKWOOL Fire Resistant Silicone Sealant is a one part alkyd cure silicone with excellent unprimed adhesion to most building surfaces. This high specification product is designed to be used in joints with high movement capability or where they are formed between dissimilar substrates, eg. steel and masonry.

**Application**

Application of ROCKWOOL Fire Resistant Silicone Sealant is a simple process as the product is extruded from a cartridge loaded into a standard sealant gun. The depth of the joint will depend on the gap to be filled and the fire rating required (see Table 1).

All surfaces must be thoroughly clean and free of bond breaking contaminants prior to application of the sealant. No priming is required for most construction substrates; however, we recommended that a small area be tested on substrates.

The sealant should not be applied if the ambient temperature is below 5°C as adhesion will be impaired.

Fire Resistant Silicone Sealant is tested to BS 476: Part 20.

**Performance & properties**

**Specification**

Once installed, ROCKWOOL Fire Resistant Silicone Sealant should provide up to 4 hours of fire protection in all joints up to 40mm.

- Installation must be fully in accordance with manufacturer’s instructions
- Once installed the sealant can offer up to 25 years service (if correctly applied).
FIREPRO® High Expansion Intumescent Sealant
Prevents the spread of smoke and flames

FIREPRO® High Expansion Intumescent Sealant is an easy to apply waterborne acrylic emulsion sealant containing graphite. It expands at temperatures above 135º celsius sealing around various penetrations and services to prevent the passage of smoke and flames.

Applications
FIREPRO® High Expansion Intumescent Sealant is recommended for use where a flexible and durable fire resistant seal is required.

Suitable applications include:
- Combustible and non combustible pipes
- Cables [ single cables or bunches of cables]
- Other permanent services
- Suitable for masonry walls

Standards & approvals
Provides up to 4 hours fire protection in joints up to 30mm. Tested to BS476: Part 20 and 22: 1987.

Application procedure
All surfaces must be clean and sound, free from dirt, grease and other contamination. Wood plaster and brick may be damp but not running wet. Use mechanical abrasion to clean porous surfaces before application.

For extra performance in movement situations, a primer can be prepared by diluting 1 part Sealant with 2 parts of water and mixing thoroughly. The primer should be brush applied and allowed to dry for 2 to 3 hours before applying sealant. Alternatively a standard PVA sealer may be used on the surface.

Prepare joint by cleaning and priming if necessary, as previously detailed. Cut nozzle to the desired angle and gun firmly into the joint to give a good solid fill. Strike off the sealant flush with the joint sides within five minutes of application, before surface skinning occurs. A small amount of shrinkage will occur on curing. If a flush finish is required, fill the joint slightly proud of the surface to allow for shrinkage.

Limitations
The sealant is not intended for application on bituminous substrates or substrates that can exude certain oils and plasticizers or solvents.

The sealant is not recommended for submerged joints or areas exposed to high abrasion.

The sealant is not suitable for food contact or medical applications.

The product has been authorised for use in LUL surface and sub-surface premises when installed in accordance with this data sheet – please refer to the LUL Approved Product Register website www.LU-apr.uk for specific details.
Insulated Fire Sleeves
Firestopping of insulated pipe penetrations

As part of the comprehensive ROCKWOOL FIREPRO® range of fire protection products, ROCKWOOL Insulated Fire Sleeves are a unique combination of stone wool and graphite intumescent. They provide all the ROCKWOOL thermal, noise and fire benefits with an added intumescent effect.

When thermally insulated plastic pipes pass through fire resisting walls and floors, the insulation is normally removed at the point of penetration to enable standard pipe collars and wraps to close the resulting void when the plastic softens and melts due to the effects of a fire. However, the removal of this insulation may result in the formation of condensation and may result in the formation of condensation on cold pipe work or heat loss from hot pipes.

ROCKWOOL Insulated Fire Sleeves avoid this problem by providing both fire stopping and thermal insulation in a single product.

ROCKWOOL Insulated Fire Sleeves are intended for use on copper, steel and most types of plastic pipes, trunking and conduits to provide up to 2 hours fire resistance.

ROCKWOOL Insulated Fire Sleeves can be used on numerous division types and under fire attack, expand both inwards to seal gaps between the sleeve and the surrounding construction.

ROCKWOOL Insulated Fire Sleeves are a unique combination of stone wool and graphite intumescent.

Applications
ROCKWOOL Insulated Fire Sleeves should be installed to the same thickness as the pipe insulation (min 25 mm thick). For un-insulated pipes, a thickness of 25 mm is required to maintain the fire resistance of the wall or floor.

For information regarding alternative pipe sizes or types, or for help regarding achieving higher integrity and insulation ratings. Please contact ROCKWOOL Technical Solutions Team for further assistance.

Advantages
- Quick, simple and accurate installation
- Maintains pipe insulation at penetration points
- Supplied with integral vapour barrier
- No mastic or ancillaries required
- Excellent thermal and acoustic insulation

Standards and approvals
ROCKWOOL Insulated Fire Sleeves have been independently tested and assessed to BS 476: Part 20 for periods of up to 2 hours fire resistance.

Description
ROCKWOOL Insulated Fire Sleeves are a unique combination of ROCKWOOL and graphite intumescent.

Supplied with a factory applied reinforced aluminium foil facing.

Dimensions
ROCKWOOL Insulated Fire Sleeves are supplied 300 mm long. They are manufactured to fit a range of standard pipe sizes, from 17 mm to 169 mm O.D. and standard thicknesses of 25 mm to 100 mm.

Other pipe sizes and thicknesses may be available to special order.

Service Temperature and Limiting Service Temperature
ROCKWOOL Insulated Fire Sleeves are used to fire stop pipe work operating at temperatures between 0°C and 180°C. At low temperatures, care should be taken to maintain the vapour barrier.

Acoustics
The use of ROCKWOOL Insulated Pipe Fire Sleeves can considerably reduce the noise emission from noisy pipework. For higher standards of acoustic insulation, it is recommended that an increased length of the pipe-work either side of the compartment wall or floor is insulated with ROCKWOOL Techwrap 2 or Techtube.

pH Neutrality
ROCKWOOL insulation is chemically compatible with all types of pipes, equipment and fittings. [Guidance is given in BS 5970 regarding the treatment of austenitic stainless steel pipework and fittings]. Stone wool insulation is chemically inert. A typical aqueous extract of ROCKWOOL insulation is neutral or slightly alkaline (pH 7 to 9.5).

Biological
ROCKWOOL is a naturally inert, rot-proof material that does not encourage or support the growth of fungi, moulds or bacteria. Stone wool does not offer sustenance to insects or vermin.

For information regarding alternative pipe sizes or types, or for help regarding achieving higher integrity and insulation ratings. Please contact ROCKWOOL Technical Solutions Team for further assistance.
**Specification clauses**

1) Supporting construction designation:
   - **Floors**: Cast concrete between 1100 and 2400 kg/m³ density
   - **M**: Masonry between 600 and 1500 kg/m³ density
   - **PB**: Plasterboard clad steel or timber stud partitions with fire resistance at least the same as the Fire Sleeve performance
   - **CB**: ROCKWOOL 50 or 60 mm thick Ablative Coated Batt

2) Insulated Fire Sleeves should extend at least 25 mm from each face of the supporting wall or floor construction to allow for effective sealing against any thermal insulation, except when used with ROCKWOOL Ablative Coated batts where a minimum of 50 mm protrusion is required from both faces.

3) The gap between the supporting construction and the Insulated Fire Sleeve should be kept as small as practical. If gaps exceed 15 mm around the sleeve or 8 mm between the service and the sleeve, these should be filled with ROCKWOOL FIREPRO® Acoustic Intumescent Sealant or FIREPRO® Firestop Compound.

4) The installed length of any Insulated Fire Sleeve shall be at least 60 mm

**Installation**

ROCKWOOL Insulated Fire Sleeves are supplied 300 mm long and are simply cut to the desired length and as a minimum, be cut flush with both faces of the wall/floor. When used in conjunction with PVC services or ROCKWOOL Ablative Coated Batt, they are required to extend beyond the face of the wall/floor. For details of how far they need to extend specification clause 2.

To maintain thermal efficiency, the Insulated Fire Sleeves should tightly abut any existing pipe insulation and where this is foil faced, all joints must be sealed with self-adhesive foil tape.

No specialist tools or ancillary materials are required for the fitting of ROCKWOOL Insulated Fire Sleeves. ROCKWOOL Insulated Fire Sleeves can accommodate irregularities in the division opening and the pipe O.D. of up to 15 mm.

Multiple pipe penetrations can be accommodated in conjunction with ROCKWOOL Ablative Coated Batt. A minimum thickness of 25 mm is required for uninsulated pipes. Thicknesses of 25 to 100 mm available to match insulation on other pipes. Manufactured to fit pipe diameters of 15 to 169 mm.
Intumescent Expansion Joint Seal

Firestop solution for linear joints in walls & floors

As part of the comprehensive FIREPRO® range of fire protection products, Intumescent Expansion Joint Seal provides an easy retro-fit solution to firestop existing construction joints up to 75mm thick in floors and walls. Tested to BS476 Part 20, Intumescent Expansion Joint Seal provides up to 4 hours fire protection.

Description

Intumescent Expansion Joint Seal is a compressible strip formed by shrink wrapping a graphite based intumescent polymer to both faces of a ROCKWOOL core.

Intumescent Expansion Joint Seal is supplied in one metre lengths to suit the joint to be filled. The width of the product is dependent on the fire rating required (see Table 1 and 2). The seal is installed by simply compressing by hand and then pushing into the joint. Adjacent pieces of the product are tightly butted together. There is no need to use any adhesives or intumescent sealant in conjunction with the product.

In a fire, the graphite based intumescent material swells to form a hard char, which prevents the passage of fire and smoke through the joint.

Intumescent Expansion Joint is suitable for use in:

- Blockwork cavities
- Curtain wall/concrete slab interfaces
- Expansion joints
- Structural joints

General benefits:

- Simple to install
- Water resistant
- Maintenance free
- Available in small quantities
- Available from 48 hours of order

Performance & properties

Intumescent Expansion Joint being a component of structure satisfies both integrity and insulation requirements as shown in the table above.

Specification

Install Intumescent Expansion Joint to provide up to 4 hours fire rating to all construction joints up to 75mm thick. Installation to be fully in accordance with manufacturer’s instructions.

Installation instructions

Intumescent Expansion Joint is used to prevent fire penetration through movement joints and gaps in walls and concrete floors for a specified period up to 4 hours. They are manufactured oversize to fit under compression.

1) Remove all loose debris and compound from the gap
2) Ensure correct width is installed to suit the required Fire Rating
3) Where the gap varies in the length to be sealed, ensure that the correct thickness is installed under compression
4) Do NOT remove sleeving
5) Keep material dry and protect from impact damage
6) Compress and insert the strip into the gap ensuring tight butt joints

Building Regulations 2013 – Approved Document B – B2/3/4 – Internal fire spread (structure), paragraphs 0.10 – 0.11, state that the spread of fire inside a building can be restricted, by provisions for elements of structure to have a specified minimum period of fire resistance. Fire resistance is defined in terms of both integrity and insulation requirements when applied to fire separating elements.

Please note that seals for joints up to 90mm wide must be fitted under a minimum of 5mm compression and joints 51-75mm must be fitted under a minimum of 10mm compression.
Intumescent Pillows
Temporary firestop solution for large voids in walls & floors

As part of the comprehensive FIREPRO™ range of fire protection products, ROCKWOOL Intumescent Pillows have been tested to BS 476:part 20 to provide up to 4 hours fire protection to metal services and cables passing through fire resisting compartment floors and walls.

General benefits:
- Simple to install
- Easy to remove and reinstate whilst changing services
- Maintenance free
- Dry system
- Available from 48 hours of order

Description
Intumescent Pillows are simply packed tightly in between penetrating services and the wall. In a floor, pillows are additionally supported by means of a mesh support system.

Figure 1 Intumescent Pillows friction fitted between services and firewall

Figure 2 Intumescent Pillows forming cavity barrier underneath raised access floor

Performance & properties

Under fire conditions, Intumescent Pillows expand several times their original volume to form an effective seal around service penetrations.

- Metal pipework
- Cable trays
- Electrical trunking (inside and outside)

Specification
Install ROCKWOOL Intumescent Pillows to provide up to 4 hours rating where services pass through fire rated walls and floors. Installation to be fully in accordance with manufacturer’s instructions.
Intumescent Pipe Wraps
Firestop solution for plastic pipe penetrations

As part of the comprehensive FIREPRO® range of fire protection products, ROCKWOOL Intumescent Pipe Wraps offer a simple and more economic alternative to Firestop Pipe Collars, for firestopping plastic pipework and electrical trunking in walls and floors. Tested to BS476 Part 20, Intumescent Pipe Wraps will provide up to 4 hours fire protection.

General benefits:
- Simple to install.
- No mechanical fixings.
- Water resistant.
- Maintenance free.
- Available to suit pipe sizes up to 160mm O.D.
- Available to fit most electrical trunking sizes.
- Available from order in 48 hours.

Suitable for PVC, UPVC, Polypropylene, MDPE & HDPE pipe materials. (Also suitable for ABS pipe material up to 155mm ØID).

Figure 3

Description
Pipe Wraps comprise layers of a graphite based intumescent sheet encapsulated in a polythene sheath. All Pipe Wraps are supplied in correct length to suit pipe diameter.

Installation instructions
The product is intended to be wrapped around the outside diameter of the pipework or trunking and is secured by means of a self-adhesive strip. The Intumescent Pipe Wrap is then positioned within the compartment wall or floor so that the edge of the product is left exposed at the face of the wall or soffit.

Under fire conditions, the intumescent material expands against the structure and fills the void left by the burnt out plastic.

For walls it may be necessary to fit two wraps depending on the fire risk areas concerned and if the wall thickness exceeds 150mm. Where pipes are insulated, please refer to the Insulated Fire Sleeve data sheet.

Intumescent Pipe Wraps are used to prevent fire penetration in plastic pipes that pass through walls or floors for a specified period of up to 4 hours. They are manufactured as a sealed unit to the correct length and width to suit the pipe diameter and fire rating.

Specification
Install ROCKWOOL Intumescent Pipe Wraps to provide up to 4 hours fire protection to all plastic pipework and electrical trunking where they pass through fire rated walls and floors. Installation to be fully in accordance with manufacturer’s instructions.
Intumescent Putty Pads (External Socket)

For the external lining of electrical socket boxes

ROCKWOOL External Socket Intumescent Putty Pads are designed for lining electrical socket boxes externally, in most forms of dry wall or plasterboard construction in both commercial and residential buildings.

Description
The pads are non-setting and flexible and will not harden, crack or dry out with age. The intumescent properties activate as temperatures reach 200°C, restricting the passage of fire and smoke.

External Socket Intumescent Putty Pads provide a fast, efficient and clean method of achieving the required fire and acoustic ratings as specified in the 2006 edition of the Building Regulations approved document part E and B, sections 7 and 7.12 b.

Performance & properties

Specification compliance
External Socket Intumescent Putty Pads have been tested to the following assessments:
- An indicative fire test based on BS476 Part 20:1987 and EN1366-3 achieved a fire rating up to 2 hours within a dry wall construction.
- Sound tested for acoustic performance values and achieved values of up to 67dB (indicating the product should uphold acoustic performance requirements of most normal partitioning systems).

</tr>
</tbody>
</table>

Applications
External Socket Intumescent Putty Pads are designed for (but not limited to) effecting a fire and acoustic seal externally around electrical socket boxes. Using the putty pads removes the need to install time-consuming baffle boxes.

Applications
- To achieve a high quality seal, ensure the socket is clean, dry and free from any dirt and dust.
- Remove the protective paper from one side of the pad and align the pad so that it fits centrally over the switchbox.
- Firmly press the perimeter of the pad to ensure it is bonded to the substrate.
- Remove the remaining protective paper and trim off any excess material to leave a neat finish.

Storage
Store in cool, dry conditions. Protect from frost.
Intumescent Putty Pads (Internal Socket)
Restricts the spread of fire in plasterboard partitions

ROCKWOOL Internal Socket Intumescent Putty Pads have been developed for use in plasterboard partitions that have been partially penetrated by electrical socket boxes. They are designed to maintain acoustic integrity and fire resistance.

General benefits:
- Provides fire protection
- Reduces noise transfer
- Pre-cut cross shape ensure hassle free installation
- Low smoke emission
- Maintenance free
- Remains malleable
- Long service life
- Available for single and double sockets

Description
Acoustic Intumescent Putty Pads are manufactured from a red, non-setting, silicone based intumescent polymer.

Installation is simple:
- Remove the face plate of the electrical socket box.
- Mould the pre-formed putty pads into the back of the box and around the cables.
- Simply replace and secure the face plate.

Under fire conditions the intumescent pad expands to fill the void left by the burnt out electrical socket box, preventing the spread of fire through the plasterboard wall. The intumescent putty can also be used for upgrading the acoustic performance of partitions where electrical socket boxes have penetrated the wall, reducing room-to-room noise transfer.

Specification
Intumescent Putty Pads are available in two sizes to suit single and double gang electrical boxes.

Fire resistance
Tested to BS476 Part 20:1987/EN1366-3, Acoustic Intumescent Putty Pads offer up to 2 hour fire resistance.

Acoustic benefits
Measurement of airborne sound insulation was made in accordance with BS EN ISO 140-3:1995. Single number quantities were calculated in accordance with BS EN ISO 717-1:1997.

Intumescent Putty Pads (Internal Socket) offer a weighted sound reduction index of up to 67db. Tests were conducted by BRE Acoustics who hold UKAS accreditation for the measurement of sound insulation in the field and the laboratory. The measurements were conducted using the procedures accredited by UKAS.

Installation should be in full accordance with manufacturer's instructions.

Linear & Trapezoidal Firestop Systems

Firestopping solutions at compartment junctions

As part of the comprehensive FIREPRO® range of fire protection products, Linear and Trapezoidal Firestop Systems have been developed to provide up to 4 hours firestopping at the junctions of compartment walls and floors. The systems have been tested in accordance with BS 476 Part 20: 1987. Solutions illustrated are for masonry walls with a density of at least 400 kg/m² and include both fire integrity and insulation criteria for concrete decks, composite decks and simple profiled sheeting.

The following NBS Plus clauses include ‘Linear & Trapezoidal Firestops’: F30-670, G30-240

The product has been authorised for use in LUL surface and sub-surface premises when installed in accordance with the data sheet - please refer to the LUL Approved Product Register website www.LU-apr.uk for specific details.

Description, performance & properties

Description
Composition and manufacture
ROCKWOOL is manufactured primarily from a melt of volcanic rock. The molten rock is spun into wool and resin impregnated. Linear and trapezoidal Firestop products are made from dense moisture resistant ROCKWOOL, allowing adequate compression yet retaining the necessary lateral stiffness for ease of installation.

Dimensions
All Firestop products are supplied in standard lengths of 1m.

Linear Firestop 2A
Rectangular strips, [Installed under min. 5% compression]
Thicknesses: 12.5, 20, 30, 40, 50, 60, 70, 80, 90, 100mm
Widths: 100, 150, 200, 300, 400mm
Fire resistance: Up to 4 hours.

Trapezoidal Firestop 2B
Trapezoidal strips (tight fit required)
Available for all profiled decks. Deck profile to be named at time of order, e.g. Ribdeck 60, Alphalok etc.

Dovetail Infill FireStop Strip
Supplied as narrow rectangular strips for pinched installation into nominated dovetail shaped deck profiles; e.g. Holorib, Quickspan, Q51 etc.
Note: Dovetail infill strips must be installed with vertical laminations.

Note: Stated performance assumes fire resistance of supporting wall is no less than the fire stop.

Chemical
ROCKWOOL stone wool has a basaltic composition in which the refractory oxide components have been enhanced for stability at high temperatures.

ROCKWOOL is chemically inert. An aqueous extract of the wool is neutral (pH7) or slightly alkaline.

Biological
ROCKWOOL Linear and Trapezoidal Firestop Systems are completely ret proof, do not offer sustenance to vermin and do not encourage the growth of fungi, moulds and bacteria.

Compatibility
ROCKWOOL products are compatible with all normal building and constructional materials with which they are likely to come into contact.

Durability
ROCKWOOL materials will perform effectively throughout the lifetime of the building with a minimum of maintenance (unless disturbed).

Environment
No CFCs, HCFcs or HFCs are used to manufacture of ROCKWOOL materials.

Design & installation
The following installation requirements must be met in order to reliably achieve the stated fire resistances.

- Linear Firestop 2A must be fitted as rectangular pieces, tightly butt jointed and compressed by at least 5% in thickness.
- Up to 3 layers may be used. Single layer firestopping will always be preferred, with multi-layer methods limited to those occasions where building tolerances demand practicality. All layers should be installed simultaneously. The height of void should not exceed the width of the firestop.
- Gaps associated with perimeter floor slab/wall firestopping should be firestopped using ROCKWOOL SP Firestop Systems.

Sealing
Small holes may be filled with ROCKWOOL Acoustic Intumescent Sealant if necessary [see data sheet for more details].

The following NBS Plus clauses include Linear & Trapezoidal Firestops: F30-470, G30-260

The product has been authorised for use in LUL surface and sub-surface premises when installed in accordance with the data sheet - please refer to the LUL Approved Product Register website www.LU-apr.uk for specific details.
Applications & fire resistances

All fire ratings apply to gaps over walls constructed of dense aggregate blocks, lightweight aggregate concrete, clay bricks, or concrete blocks, which have a density of 400 kg/m³ or more.

Fire resistance includes integrity and insulation criteria to BS 476: Part 20: 1987.

Firestop 2B

Figure 2: Profilied metal deck over blockwork wall

Figure 3: Profilied metal deck with or without lightweight concrete over universal beam

The fire resistance of the Firestop will be the same as that achieved by the fire protection of the beam.

Figure 4: Profilied metal deck under lightweight concrete cover

Figure 5

Figure 6: Concrete deck over blockwork wall

Figures 7a & 7b: Composite metal deck with profiles parallel but offset from wall line

Fig 7a: The ‘overhang’ of the Linear FireStop 2A should be supported with steel self-tapping screws or ‘hammer fix’ anchors into deck / concrete soffit at 350mm maximum centres (minimum of 3 fixings per 1m length of fire stop).

Fig 7b: Where the Linear FireStop 2A is required to be fixed to the deck at distances in excess of 400mm, turn the 1m length of fire stop 90° and cut to required size to suit profile spacing. In such cases, secure each length of fire stop to the soffit using at least 2 fixings at both ends.

Figure 8: ROCKWOOL insulated flat roof deck with profiles perpendicular to wall line

When fire stopping between the head of a fire resistant wall and the underside of a roof deck insulated with ROCKWOOL HARDROCK DD flat roof insulation, both upper and lower deck profiles may need to be filled with Trapezoidal FireStop 2B products. In such cases, when placing an order it should be noted that the sizes of the two profiles may differ.

In cases where combustible thermal insulation passes over the head of a fire resisting wall, guidance on maintaining fire compartmentation is provided in Approved Document B (Volume 2, Section B3) of The England and Wales Building Regulations 2000 (2006 edition). To reduce the risk of fire spreading to an adjacent compartment in such cases, it may be necessary to extend the wall through the roof line or introduce a ‘protected zone’ 1500mm either side of the fire resisting wall.

Typical specification

All firestopping over compartment walls and similar construction gaps to be made using ROCKWOOL Linear and Trapezoidal FireStop Systems, supplied by ROCKWOOL Ltd, Pencoed, Bridgend CF35 4XN, to meet the requirements of BS 476: Part 20: 1987 for the evaluation criteria of stability, integrity and insulation performance in accordance with Building Research Establishment Assessment No. CC 82633.

All joints of Linear and Trapezoidal Firestopping materials to be closely butted and the installation to be carried out in accordance with the manufacturer’s recommendations.

Work on site

Handling and storage

ROCKWOOL Linear and Trapezoidal Firestop materials are light and easy to handle and should be cut using a sharp bladed knife. Store in dry conditions.

Maintenance

Once installed, Linear and Trapezoidal Firestop materials will need no maintenance unless disturbed.

Shrink wrapping

For areas such as clean rooms, Firestop systems are available totally enclosed in shrink wrap.

Ordering

For linear voids between head of wall and deck soffit:-

Product: ROCKWOOL Linear Firestop 2A

Please state:
- Thickness (mm) - allowing for 5% req. compression
- Width (mm)
- Total length (m)

For trapezoidal voids in deck profile:-

Product name: ROCKWOOL Trapezoidal FireStop 2B

Please state:
- Proprietary name of profiled deck (if known)
- Whether fitting into upper or lower deck profiles
- Dimensions of deck void (mm) - Essential if proprietary deck name is unknown
- Total length required (m)

For ‘Dovetail’ voids in deck:-

Product name: ROCKWOOL Dovetail Infill FireStop Strip

Please state:
- Proprietary name of profiled deck (if known)
- Dimensions of deck void (mm) - Essential if proprietary deck name is unknown
- Total length required (m)
Multi-Cable Firestop
Firestop solution for multi-cable penetrations

As part of the comprehensive FIREPRO® range of fire protection products, ROCKWOOL Multi-Cable Firestop has been developed to effectively seal cable bunches in electrical trunking and cable trays, where they pass through fire rated walls and floors. Tested to BS476 Part 20, Multi-Cable Firestop will provide up to 4 hours fire protection.

General benefits:
- Simple to install
- Cables can be easily added or removed
- No de-rating of cables required
- Maintenance free
- Dry system

Description
Multi-Cable Firestop is a compressible fire retardant foam which is laminated both sides with a graphite based intumescent polymer. Multi-Cable Firestop is supplied in sections measuring 60mm wide x 30mm thick x 1000mm long.

Installation instructions
The product is cut to length to suit the width of the cable tray or electrical trunking to be firestopped. For example, with 100mm x 50mm electrical trunking the product would be cut into sections of 100mm long.

Multi-Cable Firestop is then laid on top of the cable runs orientating the product so that the 60mm width lies across the thickness of the wall or the depth of the floor slab.

Multi-Cable Firestop is then layered to fill the complete void depth of the electric trunking or the cable tray. Ensure electrical trunking lids are fixed back after installing the product.

</table>

1. Suitable for copper cored / PVC sheathed and insulated power cables up to 12mm diameter, secured on perforated trays/ladders or within PVC trunking passing through both walls and floors.
2. Cables and trays must be supported within 500mm on both sides of the seal.
3. Maximum of 3 layers of cables, each layer sealed with the Multi-Cable Firestop.
4. The aperture width cut from the Ablative Coated Batt should match the width of the cable tray (maximum 150mm) or PVC trunking (maximum 100mm).
5. There must be a minimum of 100mm width of Ablative Coated Batt between the penetration and the edge of the main aperture within the supporting construction.

Maximum depth filled must not exceed 60mm.

For larger voids see Intumescent Pillows, Firestop Compound or Ablative Coated Batt.

Specification
Install ROCKWOOL Multi-Cable Firestop to provide up to 4 hours fire protection in all electrical trunking and cable trays where they pass through fire rated walls and floors. Installation to be fully in accordance with manufacturer’s instructions.
SP Firestop Systems

The purpose-made solution for cavity fire stopping

As part of the comprehensive FIREPRO® range of fire protection products, ROCKWOOL SP Firestop Slab is a product specifically designed to form cavity fire stops within buildings.

It may be installed horizontally or vertically and is suitable for cavity widths between 50mm and 400mm, in both masonry and curtain wall constructions.

NB: For cavity widths of 250mm or more, joints between adjacent lengths of firestops should be sealed on the top surface with aluminium foil tape. The product has been designed as a one-piece system and allows easy cutting and installation. It provides a unique lateral compression to facilitate tightness of fit.

The product is available in two versions: SP 60 Slab, provides 1 hour fire resistance. SP 120 Slab, provides 2 hours fire resistance.

General benefits:
- Easy to cut and install
- Ensures site tolerances are accommodated
- Independently tested to provide 2 hours of fire resistance
- Resists the passage of smoke – aluminium foil faced on both sides
- Suitable for cavity widths up to 400mm
- Easy site storage and handling
- Quality assured to BS EN ISO 9001

Description, performance & properties

Description

Shape & dimensions
ROCKWOOL SP 60 Firestop Slab: 1000 x 650 x 75mm thick
ROCKWOOL SP 120 Firestop Slab: 1000 x 650 x 90mm thick
The products are faced on both sides with reinforced aluminium foil to give class O rating and excellent smoke resistance.

Both slabs are designed to be cut on-site, to produce cavity fire stops of 1000mm length and in widths to suit individual cavity sizes, as shown in Figure 1.

Figure 1: Cutting methodology for ROCKWOOL SP Firestop Slab

Figure 2: SP Firestop Fixing Bracket

Figure 3: Sectional view of Firestop Slab and Bracket

Accessories
ROCKWOOL SP Fixing Brackets* are required for the installation (figure 2). They are supplied in two standard types, namely SP/S Fixing Bracket designed for cavities up to, and including 100mm wide and SP/L Fixing Bracket for cavities over 100mm and up to 400mm wide.

Brackets are supplied in cardboard boxes, flat packed, and are designed to be easily re-profiled by hand on site. The SP Fixing Brackets should be cut on site as necessary to allow at least 75% penetration of the Firestop.

*Please note: In order to comply with the fire test certification, only ROCKWOOL SP Fixing Brackets should be used to install the product.

The following NBS Plus clauses include ‘SP Firestop System’: F30-18, F30-180, P10-432, P12-40, P12-360

SP Firestop Slab at floor / external wall junction. International Patent App. PCT/GB98/01733
Standards & approvals
ROCKWOOL SP 60 and SP 120 Firestop Slabs have been tested and assessed in accordance with BS 476: Part 20: 1987 and have achieved 60 minutes and 120 minutes respectively for both integrity and insulation, as detailed in LPC assessment CC894/79.
ROCKWOOL SP 60 and SP 120 Firestop Slabs comply with the provisions of Approved Document B3 of the 1991 building Regulations (2002 edition).
SP Firestop Systems are third party approved by the Loss Prevention Council Certification board (LPCB) for performance and quality and are listed in the Red Book - certificate no. 022b. Certificates can be accessed online at www.rockwool.co.uk or www.redbooklive.com.
The product has been authorised for use in LUL surface and sub-surface premises when installed in accordance with this data sheet – please refer to the LUL Approved Product Register website www.LU-apr.uk for specific details.

Performance
Fire
The base mineral wool of ROCKWOOL SP 60 and SP 120 Firestop Slabs is inherently fire safe and achieves Euro Class A1. ROCKWOOL products will withstand temperatures of up to 1000°C without melting.
Acoustic
ROCKWOOL products have excellent acoustic properties, and can significantly reduce the levels of airborne sound transmission through wall and floor cavities.

Resistance to moisture
ROCKWOOL SP 60 and SP 120 Firestop Slabs are water repellent and unaffected by the freeze/thaw cycle.

Applications
Fire resistance between the edge of a concrete floor slab and curtain walling which is stable in fire.
ROCKWOOL SP 60 and SP 120 Firestop Slabs provide one and two hours fire resistance respectively in voids up to 400mm wide.
Please note: Curtain walling systems should be adequately restrained to the floor.
Figure 4 illustrates a typical arrangement, using SP Fixing Brackets at 500mm centres.

Masonry wall cavities
ROCKWOOL SP 60 and SP 120 Firestop Slabs provide one and two hours fire resistance respectively in masonry wall cavities up to 400mm wide. They can be used both horizontally and vertically.
Figure 5 illustrates typical applications, with the product fitted tightly between masonry leaves. When it is not possible to build the brackets into a leaf, the fixings can be re-profiled as necessary and mechanically fixed to the face of the masonry.
The application of ROCKWOOL SP Firestop Slabs is the responsibility of the site operator. Fixing sequence instructions are shown clearly on each pack as well as cutting guide lines on the surface of each slab.

External cladding
Where used in conjunction with profiled metal cladding, cut the ROCKWOOL SP Firestop Slab to suit the profile.

Suitable for cavity widths up to 400mm*

Sitework
General
ROCKWOOL SP Firestop Slabs are designed for cutting on site with a sharp knife or saw and a straight edge. The cavity to be firestopped should be measured and the ROCKWOOL SP Firestop Slab cut to suit this dimension, using one piece only per gap width – see Figures 4 and 5.
For easy compression fitting and to accommodate the fixing pattern, cutting should be along the 1000mm width as indicated in figure 1.
The SP Fixing Brackets are then re-profiled by hand and cut as necessary to allow at least 75% penetration of the fire stop material.
They should be placed as shown in the diagrams, or fixed by other suitable mechanical means.

General
The fixing sequence is as follows:
- Cut the ROCKWOOL SP Firestop Slab allowing an additional 3–5mm for compression when fitted.
- The ROCKWOOL SP 60 or SP 120 Firestop Slab is impaled onto the SP Fixing Brackets at the rate of 2 per 1000mm length, fixed at 500mm ±10mm centres, as shown in Figure D. The SP Fixing Brackets should be placed 250mm ±10mm in from each end of the ROCKWOOL SP Firestop Slab.
- The product should then be fitted securely into the void, and tightly butted to the adjacent ROCKWOOL SP Firestop Slab.
- Once the ROCKWOOL SP Firestop Slab has been accurately fitted, the SP Fixing Brackets must then be mechanically fixed to the edge of the floor slab with metal fixings suitable for masonry.

Masonry wall cavities
The fixing sequence is as follows:
- Cut the ROCKWOOL SP Firestop Slab to suit the cavity size, ensuring a tight fit.
- After suitably re-profiling the SP Fixing Brackets, they can be built into the bed joints of the inner leaf at 500mm ±10mm centres. Alternatively, the SP Fixing Brackets may be re-profiled by hand into an ‘L’ shape and mechanically fixed to the face of the inner leaf.
- The ROCKWOOL SP Firestop Slab is then impaled onto the SP Fixing Bracket after the next lift of inner leaf masonry.
- Work on both leaves can then be continued and must include either a vertical damp proof course or a cavity tray, installed over the ROCKWOOL SP Firestop Slab as shown in Figure 5.

*Please note: For cavity widths of 250mm or more, joints between adjacent lengths of firestops should be sealed on the top surface with aluminium foil tape.
CONSTRUCTION TYPE CAVITY BARRIERS

Masonry wall cavity

The cavity barrier is ROCKWOOL SP 60 or SP 120 Firestop Slab to provide 1 hour or 2 hour fire resistance for both integrity and insulation criteria (LPC assessment CCB/96/97). Fixings are ROCKWOOL SP/S or SP/L Fixing Brackets, fixed in accordance with the details given in this data sheet. A damp proof membrane or cavity tray is to be installed during the construction of the outer leaf. Slabs should be cut to suit the width of the as-built cavity and securely fitted. All joints are to be tightly butted.

Curtain walling and external cladding systems

ROCKWOOL SP FireStop Slabs will provide fire stopping in conjunction with a stable, external façade system. During a fire, if the behaviour of the facade panel or its fixing is such that a gap develops between the ROCKWOOL SP FireStop Slab and the panel allowing fire to pass through, ROCKWOOL Limited cannot accept liability for failure. Specifiers should ensure that the choice of the curtain walling components will not diminish firestopping requirements.

Curtain walling systems are manufactured from a wide range of materials which react differently in fire. Large scale independent UK investigations have shown that some glazed or aluminium external cladding systems are liable to integrity failure under attack, within short periods of time - 5 and 20 minutes respectively.

Steel faced composite panels filled with combustible insulation can be unstable under fire attack. Curtain walling systems incorporating fire-sensitive panels may suffer severe movement and buckling, resulting in gaps forming between the panel and the ROCKWOOL SP FireStop Slab.

Ordering

There are 4 slabs per standard pack. Please quote ROCKWOOL SP 60 or SP 120 Firestop Slab and the number of packs and brackets required.

ROCKWOOL Ablative Coating

As part of the comprehensive FIREPRO® range of fire protection products, ROCKWOOL Ablative Coating is used to manufacture ROCKWOOL Ablative Coated Batts. These are manufactured by spraying specially produced, high density ROCKWOOL insulation with an additional fire protection provided by ROCKWOOL ablative coating. This is a fully automated process to ensure an even thickness of coating.

ROCKWOOL Ablative Coating is used to further improve the fire resistant properties of ROCKWOOL stone wool slabs. The ablative nature of the coating resists flame spread and forms an insulated char which protects the stone wool slab. The Ablative Coating is available separately to enable site repairs to Ablative Coated batts, that may have been damaged during installation.

ROCKWOOL Ablative Coated Batt is intended to act as an airseal barrier to reinstate the fire resistance and acoustic performances of concrete floors, masonry walls and dry wall systems when voids have been created for the passage of services. This includes pipes made of plain or stainless steel, cast iron, copper, polypropylene (PP), high density polyethylene (HDPE), Pvc and ABS along with all sheathed cables up to 80mm and supported cable bundles up to 100mm.

Description

ROCKWOOL Ablative Coating is a water based coating which may be brush or spray applied to stone wool slabs. The coating is available in white and in other colours subject to minimum order quantities. The coating may be over painted if desired. Ablative Coating is available in 5L tubs.

General benefits:

- Designed to be spray or brush applied onto ROCKWOOL Ablative Coated Batts
- Dries to give a sound, flexible white surface finish
- During installation of Ablative Coated Batts, the cured coating reduces de-lamination and increases surface stability for adhesive and fixing sealant application

Fire performance

ROCKWOOL Ablative Coated Batt has been tested to the dedicated fire resistance standard for penetration seals- prEN 1366-3. The independently prepared assessment, detailing the full scope of fire performance, is available from the ROCKWOOL Technical Solutions Team. Ablative Coated Batt fire resistance tests were conducted using ROCKWOOL Acoustic Intumescent Sealant and/or ROCKWOOL FIREPRO® Glue.

Limitations

ROCKWOOL Ablative Coating and stone wool slabs may only be used to fire protect service penetrations if supported by independent fire test evidence due to the variants in the density and thicknesses of stone wool slabs available.

Technical advice

For specific integrity and insulation ratings for the various services, please consult ROCKWOOL Standard Details, available via www.rockwool.co.uk

* Please refer to ROCKWOOL Technical Solutions for guidance on suitable paints.

Site use

Storage and handling

ROCKWOOL SP Firestop Slabs are light and easy to handle. They are supplied in compression wrapped polyethylene, which will provide short term protection. For long term storage they must be protected by a waterproof covering.

Estimating quantities

The chart below indicates the usage of ROCKWOOL SP Firestop Slabs and fixings, assuming accurate site cutting practices.

Typical specifications

Curtain Wailing

The cavity fire stop between the edge of the concrete floor slab and curtain wailing is to be ROCKWOOL SP 60 or SP 120 Firestop Slab as manufactured by ROCKWOOL Limited, Bridgend CF35 6NY to provide 1 hour or 2 hour fire resistance for both integrity and insulation criteria (LPC assessment CCB/96/97). Fixings are ROCKWOOL SP/S or SP/L Fixing Brackets, fixed in accordance with the details given in this data sheet.

Slabs should be cut to suit the width of the as-built cavity, allowing an additional 3-5mm for compression, and securely fitted into the void. All joints are to be tightly butted.

ROCKWOOL Ablative Coating

As part of the comprehensive FIREPRO® range of fire protection products, ROCKWOOL Ablative Coating is used to manufacture ROCKWOOL Ablative Coated Batts. These are manufactured by spraying specially produced, high density ROCKWOOL insulation with an additional fire protection provided by ROCKWOOL ablative coating. This is a fully automated process to ensure an even thickness of coating.

ROCKWOOL Ablative Coating is used to further improve the fire resistant properties of ROCKWOOL stone wool slabs. The ablative nature of the coating resists flame spread and forms an insulated char which protects the stone wool slab. The Ablative Coating is available separately to enable site repairs to Ablative Coated batts, that may have been damaged during installation.

ROCKWOOL Ablative Coated Batt is intended to act as an airseal barrier to reinstate the fire resistance and acoustic performances of concrete floors, masonry walls and dry wall systems when voids have been created for the passage of services. This includes pipes made of plain or stainless steel, cast iron, copper, polypropylene (PP), high density polyethylene (HDPE), Pvc and ABS along with all sheathed cables up to 80mm and supported cable bundles up to 100mm.

Description

ROCKWOOL Ablative Coating is a water based coating which may be brush or spray applied to stone wool slabs. The coating is available in white and in other colours subject to minimum order quantities. The coating may be over painted if desired. Ablative Coating is available in 5L tubs.

Ablative Coated Batt fire resistance tests were conducted using ROCKWOOL Acoustic Intumescent Sealant and/or ROCKWOOL FIREPRO® Glue.

Limitations

ROCKWOOL Ablative Coating and stone wool slabs may only be used to fire protect service penetrations if supported by independent fire test evidence due to the variants in the density and thicknesses of stone wool slabs available.

Technical advice

For specific integrity and insulation ratings for the various services, please consult ROCKWOOL Standard Details, available via www.rockwool.co.uk

* Please refer to ROCKWOOL Technical Solutions for guidance on suitable paints.
CONSTRUCTION TYPES: CAVITY BARRIERS

TCB & PWCB Cavity Barriers
Fire Protection for timber frame & masonry cavity walls

Preventing fire spreading through concealed voids is essential for improving safety and property protection. One of the best ways to achieve this is to correctly specify and install cavity barriers.

ROCKWOOL Cavity Barriers have been specifically developed to exceed minimum building regulation requirements for fire resistance in concealed wall cavities. They have been tested and assessed for up to 60 minutes fire resistance (Integrity and Insulation).

Advantages
- Easy to install
- Durable products withstand on-site handling
- Once installed, performance is not affected by movement in the building, shrinkage or thermal change
- Can be used vertically or horizontally

Standards and approvals
ROCKWOOL TCB Cavity Barriers are also approved by the Loss Prevention Certification Board (LPVB) for performance and quality. 1991 (2000 edition.)

Fire Performance
ROCKWOOL Cavity Barriers are manufactured from non-combustible stone wool, which has a Euroclass A1 fire rating when classified in accordance with BS EN 13501-1 and BSI Quality Assurance Standard B5 EN ISO 9001: 2000.

The Cavity Barriers have been tested and assessed for up to 60 minutes fire resistance (integrity and insulation) in accordance with BS 476: Part 20.

Description
PWCB Cavity Barrier also provides effective perimeter edge sealing that helps to minimise air leakage and heat loss between the external cavity and separating party wall.

Performance
ROCKWOOL PWCB cavity barrier also achieves the requirements for fire safety, acoustic flanking and thermal bypass in one single product.

ROCKWOOL TCB & PWCB cavity barriers are manufactured from non-combustible stone wool, encapsulated within a resilient polythene sleeve which eliminates the need for weather protection during installation. The sleeves are also colour-coded to differentiate between the two products, TCB’s being red and PWCB’s white.

Fire
The use of ROCKWOOL Cavity Barriers satisfies the requirements of:
- Approved Document B (Domestic) B3 – Section 6: Concealed spaces (Cavities)
- Approved Document B (Non-domestic) B3 – Section 9: Concealed spaces (Cavities)
- Scottish Technical Handbook Section 2 – Fire Section 2.4: Cavities

ROCKWOOL TCB Cavity Barriers are approved by the Loss Prevention Certification Board (LPVB) for performance & and quality and are listed in the Red Book Certificate No 022b.

Acoustics
ROCKWOOL Cavity Barriers comply with the generic description for cavity closers to prevent flanking noise transmission, along concealed cavities in both external and separating walls.

Thermal
ROCKWOOL PWCB Cavity Barrier will assist in providing an effective perimeter edge seal between the external cavity wall and separating party wall (party wall thermal bypass).

Fixing and jointing
All ROCKWOOL Cavity barriers are 1200mm long and are designed to be compression fitted within the cavity (min 10mm-15mm compression). The barriers do not rely on the polythene flanges to hold them in place in the event of a fire.

Applications
ROCKWOOL Cavity barriers can be used in both vertical and horizontal applications.

In vertical applications, both flanges of the cavity barrier can be fixed to the inner leaf at 150mm centres, using staples or clout nails prior to compression fitting by outer cavity wall.

In horizontal applications, only the top flange of the polythene sleeve should be fixed.

External walls masonry constructions:
(Full Fill & Partial Fill cavity insulation)

Fully filled cavities in external walls
Where the external wall cavity is fully filled external cavity barriers are generally not required in the outer wall.

Partially filled cavities in external walls
Where partial fill insulation is used in the external wall, the insulation should be cut back to permit the cavity barrier to be compression fitted between the inner and outer leaves. The head of the cavity wall should also be closed at eaves level with the ROCKWOOL TCB cavity barrier.
Ways to limit heat loss:

- **Perimeter edge sealing only:** Thermal regulations allow a U-value of 0.20W/m²K to be claimed when effective perimeter edge sealing is used around all exposed edges of the party wall.

- **Perimeter edge sealing plus fully filling the party wall cavity:** A U-value of zero can be claimed if the party wall cavity is fully filled with an appropriate mineral wool insulation, and effective perimeter edge sealing is provided around all exposed edges.

### Advantages of ROCKWOOL PWCB

- Provides perimeter edge sealing minimising air leakage and heat loss between the external cavity wall and the party cavity wall.
- **Non Combustible:** Meets building regulation requirements for a cavity barrier.
- Tested and assessed to BS 476: Part 20 for use in all concealed cavities within masonry & timber framed constructions.
- Satisfies three regulation requirements with one single product.
- PWCB can be used in both horizontal and vertical applications.
- **Thermal:** Party wall thermal bypass: PWCB meets the requirements for an effective party wall perimeter edge seal, by restricting air flow around the exposed edges of party wall cavities.
- **Fire:** Acts as an effective cavity barrier: ROCKWOOL PWCB provides an excellent acoustic absorber within the building regulations.

Fire Duct Systems

Single layer fire protection for rectangular, circular & oval ducts

As part of the comprehensive ROCKWOOL FIREPRO® range of fire protection products, Fire Duct Systems (previously Conflit® Ductwork Systems) provide fire protection and thermal and acoustic insulation for circular and rectangular steel ductwork.

Three products are available in the Fire Duct Systems range:

- Fire Duct Slab – for rectangular ducts
- Fire Duct Section – for circular ducts between 60 mm and 356 mm diameter
- Fire Duct PSM – for circular ducts greater than 486 mm diameter

All three Fire Duct products are supplied faced on one side with reinforced aluminium foil.

Advantages

- Specified with confidence
- Quick and easy to install
- Fully certified to BS 476-24 (duct types A and B)
- ½, 1, 1½ and 2 hour fire protection for stability, integrity and insulation
- Choice of fixing options
- Single layer, enabling verification of system installation
- Space efficient, non-brittle, strong and safe
- Multi-rele insulation: fire protection, acoustic and thermal
- Can be installed on standard DW144/42 ductwork.

Standards and quality approvals

Three performance criteria; stability, integrity and insulation, are required in equal measure for all ducts which pass through fire-rated walls or floors.

BS 9999:2008- Protection using Fire Resisting Ductwork Clause 33.3.4 requires that:

The fire resistance of ductwork, when tested from either side, should be not less than the fire resistance required for the elements of construction in the area through which it passes.

BS 476 – 24, Clause 9.1 states that:

The fire resistance of test specimens shall be the duration in minutes, of heating in accordance with 5.1.1, until failure occurs according to one or more of the performance criteria, i.e. stability, insulation, integrity, or until the test is terminated, whichever is the shortest time.

Duct System Test Data

The Fire Duct products have been tested and assessed by the Loss Prevention Council Certification board (LPcB) for performance and quality and are listed in the "Red Book" - certificate no. 0211. Certificates can be accessed online at www.rockwool.co.uk or www.redbooklive.com

Description

Fire Duct Slab is a high density insulation slab faced with reinforced aluminium foil.

Fire Duct Section is a high density pre-formed pipe section faced with reinforced aluminium foil.

Fire Duct PSM is a high density slab with factory machined grooves to facilitate installation around a circular duct, faced with reinforced aluminium foil.

Fire Duct products can be used to provide fire protection to horizontal, vertical, rectangular, circular, ventilation and smoke extract steel ductwork fully in accordance with BS 476 – 24, ducts 'Type A' and 'Type B', 'Fire outside duct' and 'Fire inside duct'.

The ½, 1, 1½, and 2 hours periods of fire resistance stated in this manual are for stability, integrity and insulation in equal measure. For example, the 60 minutes duct constructions shown are certified for 60 minutes stability, 60 minutes integrity and 60 minutes insulation.

'Kitchen extract' ducts

These are subject to separate BS 476-24 requirements and are additionally covered for ½ and 1 hour protection periods.

Fire Duct Systems are third party approved by the Loss Prevention Council Certification board (LPcB) for performance and quality and are listed in the "Red Book" - certificate no. 0211. Certificates can be accessed online at www.rockwool.co.uk or www.redbooklive.com

Fire Duct Slab

Size: 1200 x 2000 mm
- Thicknesses: 40, 50, 70 and 90 mm*
- Facing: reinforced aluminium foil

Fire Duct Section

Diameters: 60 to 356 mm
- Thicknesses: 30, 40 and 90 mm
- Facing: reinforced aluminium foil

Fire Duct PSM

(Made of Fire Duct Slab with factory machined grooves to suit specific duct diameters)
- Diameters: 456 mm and above
- Thicknesses: 40 and 90 mm*
- Facing: reinforced aluminium foil

Fire Duct Section for use on hangers

- Nominal OD from 17 mm
- Thicknesses: from 30 mm*
- Facing: reinforced aluminium foil

Fire Duct PSM – for circular ducts greater than 486 mm diameter

Fire Duct Section – for circular ducts between 60 mm and 356 mm diameter

Fire Duct Slab – for rectangular ducts

Reaction-to-Fire

Fire Duct Slab
- Surface spread of flame: Class 0 to BS 476–7
- Non-combustibility: Class A1 to BS EN 13501-1

Fire Duct Section
- Surface spread of flame: Class 0 to BS 476–7
- Sections >300mm external diameter: A1 to BS EN 13501-1 (Non-combustible)
- Sections >300mm external diameter: A2 to BS EN 13501-1 (Limited combustible)

Fire Duct PSM
- Surface spread of flame: Class 0 to BS 476–7
- Non-combustible – Class A1 to BS EN 13501-1

pH Neutrality

ROCKWOOL insulation is chemically compatible with all types of pipes, equipment and fittings. Guidance is given in BS 5970 regarding the treatment of austenitic stainless steel pipework and fittings. Stone wool insulation is chemically inert. A typical aqueous extract of ROCKWOOL insulation is neutral or slightly alkaline (pH 7 to 9.5).

Durability

ROCKWOOL has been proven in service for over 50 years in all types of typical internal applications. Fire Duct Systems will give effective protection for the lifetime of the ducts that they insulate.

Biological

ROCKWOOL is a naturally inert, rot-proof material that does not encourage or support the growth of fungi, moulds or bacteria. Stone wool does not offer sustenance to insects or vermin.

www.rockwool.co.uk or www.redbooklive.com

The product has been authorised for use in LUL surface and sub-surface premises when installed in accordance with this data sheet – please refer to the LUL Approved Product Register website www.LUL-apr.uk www.LUL-apr.uk for specific details.
**Application**

**System options – rectangular ducts**

**Welded pin fixing method**

Attachment by welded pins allows extremely rapid installation with slab joints simply butted together.

Welded pins are generally spaced at 350 mm maximum centres along the length of the duct and at 500 mm maximum centres across the width and depth of the duct. Pins are required on all four sides of vertical ducts, but may be omitted from the top face of horizontal ducts, see Figures 5 and 6.

Longitudinal corner joints fixed with pigtail screws at 250 mm maximum centres (screw length to be 2 x slab thickness). Side wall slabs must overlap top and bottom slabs (as shown). Cross joints bonded with FIREPRO® Glue.

**Alternative joint methods**

Instead of pigtail screws, longitudinal joints can be fixed with FIREPRO® Glue and nails, at 500 mm max. centres.

Instead of glue, cross joints can be protected with centrally positioned, 100 mm wide Fire Duct strips fixed along both edges with pigtail screws at 250 mm max. centres.

**Mitre-joint fixing methods**

The use of mitre-joints at slab corners allows installation in situations where welding may not be practical.

**Mitre-joint method**

All joints bonded with ROCKWOOL FIREPRO® Glue. Lateral joint corners secured with nails while ROCKWOOL FIREPRO® Glue cures.

---

**System options – circular ducts**

**Fire Duct Section**

Circular steel ducts of between 60 mm and 356 mm diameter may be protected using Fire Duct Section.

Fire Duct Section must be glued with ROCKWOOL FIREPRO® Glue at the joints and in the grooves. Steel bands or wires must be fitted circumferentially to the system at 300 mm nominal centres to hold all joints and grooves tightly closed while the glue cures.

Where required, cover strips and bearer protection pieces are to be cut from Fire Duct Section (or Fire Duct PSM) of the appropriate diameter. The foil covering is to be removed from the area of Fire Duct Section immediately beneath the cover strips prior to gluing into position and securing with steel nails or pins.

All joints are to be securely taped with 75 mm wide plain soft aluminium foil self-adhesive tape (Idenden type T303, or similar and approved) to maintain a continuous vapour barrier.

The hanger system is as described in our FIREPRO® Brochure and as shown in figure 1 and 2, with the angle bearer formed into a circular shape to suit the diameter of the duct or the Fire Duct Section (depending on whether the hanger is located inside or outside the protection).

Fire Duct Section is used to protect the drop rods as described in this brochure. General installation principles are as otherwise described in this Product Data Sheet for Fire Duct Slab.

**Fire Duct PSM**

Circular steel ducts of 406 mm and greater diameter may also be protected using Fire Duct PSM.

Fire Duct PSM must be glued at the joints and in the grooves with ROCKWOOL FIREPRO® Glue. Steel bands or wires must be fitted circumferentially to the system at 300 mm nominal centres to hold all joints and grooves tightly closed while the glue cures.

General duct, hanger and installation details are as described for Fire Duct Section.

---

CONSTRUCTION TYPE
VENTILATION DUCTWORK
VeNtILAtION DUctWOrK
FIre PrOtectIOn

hangers, bearers and flanges
Fire Duct products are approved to provide fire protection to steel ductwork, wholly constructed using steel fixings in accordance with current HVAC specification DW/144 and superseded specification DW/142.

Where there are constructional options within DW/144 and DW/142, these are expanded upon below. These details are primarily concerned with duct joint types and the suspension method.

Where required, 1–1.5 mm of glue should be applied to each Fire Duct joint. The glue is generally applied by spatula or trowel.

Where present, any foil facing must be removed from surfaces prior to the application of ROCKWOOL FIREPRO® Glue. Take care to remove any FIREPRO® Glue from all aluminium foil surfaces with a damp cloth.

Nails (for use only with mitre-joint ‘glued’ systems) The nail length is to be 2 x board thickness (see Figure 7 for positions).

Pigtail screws Pigtail screws are to be used at all corner joints where FIREPRO® Glue is not used, and to secure cross joint cover strips. Pigtail screws are to be positioned at 250 mm maximum centres, and the screw length is to be 2 x slab thickness.

For horizontal ducts, pigtail screws must be inserted horizontally.

Optional edge protection Light gauge metal angles may be glued in position to provide optional edge protection. The metal angles must be degreased. Small pins may be required to hold the angle to the underside of the duct.

Vapour barrier Where a vapour barrier is required, all exposed Fire Duct edges and penetrations through the foil must be sealed using aluminium foil tape.
Wall penetrations, elbows, 2 and 3-sided applications and access hatches

Wall and floor penetrations
Support to duct sides is required at all penetrations for stability purposes. This support can be provided by:

- A 30 x 30 x 2 mm mild steel angle frame fixed to the duct at the penetration mid point. Steel rivets should be used at 300 mm maximum centres [Figure 8].
- Locating the duct joint at the penetration mid point.

In all cases, low density ROCKWOOL is packed tightly into the void between the Fire Duct product and the wall opening.

120 mm wide blocks of Fire Duct are glued (or secured with pigtail screws) to the duct insulation and to the wall on both sides of the penetration.

All Fire Duct to wall joints are glued. Aluminium foil is located in Fire Duct joints at wall penetrations (as shown).

Access hatches (rectangular ducts)
Steel access hatches which are constructed and fitted in accordance with DW/144 may be protected with Fire Duct Slab [Figure 11].

The Fire Duct cover may be fitted in any face of the duct. However, if the sliding cover is not in the horizontal plane the guides must be positioned so as to prevent movement of the cover due to weight, vibration etc.

The sliding cover must be a tight fit in the guides. No part of the arrangement may be within 50 mm of edges or joints within the main duct protection layer of Fire Duct Slab.

All Fire Duct Slab joints (excluding sliding joints) are to be glued and pinned as previously detailed.

Access hatches (circular ducts)
Details of access hatches for circular ducts are available on request.

Criteria for preparation of ductwork prior to insulation
Fire Duct products are certified to provide fire protection to ductwork conforming to Construction Details 1 to 12 in the table below and to the requirements of HVCA Specification DW/144. The table may be used as a check list for on-site verification of ductwork construction.

**Specification clauses**

**Typical specification clauses for rectangular ducts to be read in conjunction with the Fire Duct Systems options**

**Welded pin fixing method**

1) All ductwork is to be insulated with ..........* mm ROCKWOOL Fire Duct Slab, having a factory applied reinforced aluminium foil to one face and complying with Building Regulations Class ‘O’ requirements.
2) The Fire Duct Slab is to be fixed to the duct using 2.5 mm diameter welded steel pins and 38 mm spring steel washers in accordance with the ROCKWOOL Product Data Sheet ‘Fire Duct systems’.
3) The foil facing is to be removed from any surfaces to which FIREPRO® Glue is to be applied.
4) All corner joints are to be fixed with pigtail screws at 250 mm maximum centres. Screw length is to be 2 x slab thickness.
5) All cross joints are to be filled with FIREPRO® Glue and held tightly closed.
6) Drop rods and bearers are to be at 1500 mm maximum centres and to be M10 steel rod and 30 x 30 x 3 mm steel angle respectively. Ductwork is to be generally in accordance with HVCA Specification DW144.
7) All drop rods and exposed bearers are to be insulated with ..........* mm Fire Duct Slab or ..........† x ..........* mm Fire Duct Section, as appropriate. Rebates or cover pieces are to be used at duct flange and bearer locations according to site conditions and subject to ROCKWOOL approval.
8) Where a vapour barrier is required, all exposed Fire Duct edges and penetrations through the foil should be sealed using soft self-adhesive aluminium foil tape.

**Mitre-joint fixing method**

1) All ductwork is to be insulated with ..........* mm ROCKWOOL Fire Duct Slab, having a factory applied reinforced aluminium foil to one face and complying with Building Regulations Class ‘O’ requirements.
2) The Fire Duct joints at ductwork corners are to be 45° mitred. Square butts joints to be used elsewhere.
3) The foil facing is to be removed from any surfaces to which FIREPRO® Glue is to be applied.
4) All joints are to be filled with FIREPRO® Glue and held tightly closed.
5) All mitred joints are to be held tightly closed with nails (length = approx. 2 x Fire Duct Slab thickness) until the glue has fully cured. 2 nails juxtaposed at 90° are to be located at 3 points per 1200 mm length of mitred joint and at 5 points per 2000 mm length.
6) Drop rods and bearers are to be at 1500 mm maximum centres and to be M10 steel rod and 30 x 30 x 3 mm steel angle respectively. Ductwork is to be generally in accordance with HVCA Specification DW144.
7) All drop rods and exposed bearers are to be insulated with ..........* mm Fire Duct Slab or ..........† x ..........* mm Fire Duct Section, as appropriate. Rebates or cover pieces are to be used at duct flange and bearer locations according to site conditions and subject to ROCKWOOL approval.
8) Where a vapour barrier is required, all exposed Fire Duct edges and penetrations through the foil should be sealed using soft self-adhesive aluminium foil tape.

**Alternative longitudinal joints**

Delete clauses 3 and 5 in Method 1 above, and insert new clause 5:
5) All joints are to be filled with FIREPRO® Glue and held tightly closed. Use nails at 500 mm centres at corner joints to aid this process.

**Alternative cross joints**

Delete clauses 3 and 5 in Method 1 above, and insert new clause 5:
5) All cross joints are to be covered with centrally positioned 100 mm wide strips of Fire Duct Slab of the same thickness as the insulation. The cover strips are to be fixed along both edges using pigtail screws at 250 mm max. centres.

* Insert Fire Duct Slab insulation thickness required.
† Insert appropriate overall diameter.
Fire Tube
Fire protection for process pipes and structural steel

As part of the comprehensive FIREPRO® range of fire protection products, Fire Tube is a rigid, pre-formed cylindrical section of ROCKWOOL specially engineered to provide cellulose fire protection to circular section structural steel, and to process, sprinkler and service pipes. In addition to fire protection, Fire Tube provides a high degree of thermal and acoustic insulation.

Certification
Full-scale independent test data has been verified and assessed by BRE Global in Fire report number: CC 276856A. The fire performance of Fire Tube has been reviewed by the Fire Test Study Group for inclusion in the ASFP Yellow Book, endorsed by the Steel Construction Institute.

British standards
Fire Tube conforms to BS 3956: Part 4, ‘Bonded preformed mineral wool pipe sections’.

Performance data
Fire report CC 276856A details the expected fire resistance performance relating to critical steel temperatures of 50, 100, 150, 200, 250, 300, 350, 400 and 550°C for periods of up to 4 hours.

The required wall thickness of Fire Tube to provide a particular fire resistance for a specified period depends on the diameter, wall thickness and critical (fail) temperature of the steel column or pipe. However, in the case of pipes, the critical temperature is likely to depend on its contents. The product has been authorised for use in LUL surface and building materials, the fire performance of Fire Tube has been reviewed by the Steel Construction Institute.

Sizes
Fire Tube is available to suit common metal structural column and pipe diameters in the range between 21 to 610mm

Table 1 Critical steel temp 600°C (for offshore & marine)

Description, performance & properties

**General benefits:**
- Range of wall thicknesses to accommodate specific steelwork, pipe and content fail temperatures
- Individually manufactured to fit pipe and CHS sizes up to 610mm outside diameter
- Proven in use for over 40 years
- Simple to install
- Excellent thermal and acoustic insulation
- Moisture resistant (should be weather protected for external use)
- Non Combustible (Class A1 in accordance with EN 13501-1)

**Installation specification**
Cylindrical steel elements to be fire protected for the fire test. Use 25mm thick ROCKWOOL Fire Tube and fitted in accordance with the following method.

All ROCKWOOL-to-ROCKWOOL joints of the Fire Tube
(including the partially split ‘hinge’ and the tube ends) to be filled with FIREPRO® Glue prior to application. All joints to be held firmly together with temporary bands of steel wire, jubilee clips or plastic cable ties at 200mm centres until adhesive within joints and between Tube ends has fully cured.

**Structural steel fire protection**
The section factors A/V (Hi/gA) for standard structural steel sections can be found in the ASFP Yellow Book or can be calculated for each element by dividing the perimeter (circumference) exposed to fire (A) by the cross sectional area (V). For circular sections (including pipes), the following, simplified formulae can be used to calculate the A/V section factors:-

Solid sections: A/V = 4 / OD

Hollow sections: A/V = OD / (thk x OD - thk2)

Where OD = outside diameter in m and thk = wall thickness in m

**Worked example for CHS or Pipe**

**Outside diameter:** 219.1mm (0.2191m)

**Wall thickness:** 8.0mm (0.008m)

**Circumference (A):** 6.8846m

**Cross sectional area (V):** 0.00531m²

Section factor (A/V): 130m⁻¹

**Tables 1 and 2** provide the wall thickness of Fire Tube necessary to restrict the core design temperature of circular steel elements (based on their limiting section factors) to 400°C and 550°C respectively, during exposure to cellulose fire test. The design temperature is defined as the mean temperature at which a beam or column is assumed to be capable of supporting a specified load. Similar tables for critical temperatures of 50°C, 100°C, 150°C, 200°C, 250°C, 300°C and 350°C are also available from the ROCKWOOL Technical Solutions Team.

**Pipework fire protection**
The critical failure temperature of a pipe will depend on the material it is made of, or its contents e.g. water or oil. Table 3 provides the minimum required wall thickness of Fire Tube for a variety of critical failure temperatures to provide 60 minutes fire resistance to a 219.1mm OD steel pipe with an 8mm wall thickness – Section factor (A/V) of 130m⁻¹

**Critical temperature of pipe material or contents**

**Wall thickness of Fire Tube**

Cutting
Fire Tube is light and easy to cut to shape using a saw or a sharp knife.

Weather protection
If installed outdoors, Fire Tube must be protected from the weather. Prior to use, Fire Tube should be stored indoors or protected by a weather proof covering.

---

The product has been designed for use in UK roof and wall surface protection where installed in accordance with this data sheet. Please refer to the UK Approved Product Register website at https://www.rockwool.com/a-pr for specific details.

Certificate number 022d(1)
FIREPRO® Glue

Fire resistant adhesive for FIREPRO® fire protection systems

As part of the comprehensive FIREPRO® range of fire protection products, FIREPRO® glue has been specially developed for fixing ROCKWOOL fire protection systems. It is also suitable for glue fixing other suitable ROCKWOOL products where a fire resistant adhesive is needed.

Description
FIREPRO® glue is a water-based product with an approximate pH 11, supplied in 17 kg plastic tubs. FIREPRO® glue must always be stirred before use to ensure a uniform product consistency.

Generally storage should be made in frost free conditions. Frost exposure does not remove curing ability.

Please note that the temperature of FIREPRO® glue must be followed by thorough stirring.

Air humidity
Thicknecss of glue layer in a joint

Air access to glued joint (i.e. not sealed off)

Application
Application of glue is typically made by a pallet knife or trowel before pressing surfaces together. Fixing boards together is supplemented by nails, pins or staples through noggin – board joints, and board - board joints.

Whilst steel surfaces may be acceptable when just moist to the touch, heavy water droplets, grease, scale oxide, dust etc should be removed prior to the application of FIREPRO® glue.

Testing has shown that even if glued joints are immediately subjected to heavy frost exposure, the final glued joint strength is not threatened, but curing is retarded.

Effects of ambient conditions

1) For all year round working, noggins should be cut to provide approximately 0.5mm interference fit into steelwork. Some friction in the fitting is required to satisfy all conditions and to provide a sensible limit to glue thickness.

2) In typical dry summer conditions of 20°C, curing of the basic glue will occur in approximately 4 hours before cover boards should be added onto the noggins.

3) The setting times of glue in moist air conditions is approximately 6-8 hours if the temperature is above freezing point, or in approximately 1 hour at 20°C.

Application of glue

Approx 20°C dry conditions
Approx 3°C+ with moist air conditions
-10°C to 0°C

<td>but full cure may be delayed over 24 hours when temperatures 0 – 4°C</td>
</tr>
</tbody>
</table>

Noggins to steelwork

Exhaustive testing has been made under various application conditions. ALL noggins fitted into steelwork should be cut to provide an interference friction fit of approximately 0.5mm. Excessive oversizing causing the noggins to bend should be avoided (refer to Figure 1). The noggins should be installed so as to be just proud of the flange tips. For web depths greater than 500mm ‘solid’ noggin or ‘T’ noggins ROCKWOOL BEAMCLAD® must be used.

Again a nominal 0.5mm interference fit is recommended for all ambient conditions, but particularly for winter working. All noggins edges in contact with steelwork must be glued.

FIREPRO® Glue curing data

- Glue fixed noggins must be allowed to set fully before any attempt is made to fix cover boards. Table 1 suggests minimum times to allow such setting to occur between ROCKWOOL BEAMCLAD® noggins and steelwork.

- Please note: when friction fitted glued joints are exposed to sub zero temperatures either immediately, or at some time during the curing process, an adequate bond stability will form in approximately 1 hour. This bond will be sufficient for cover boards to be applied.

- Adequate setting will continue as in Table 1 when frost free conditions return, but stability will be provided by the supplementary pins or nails. The final strength of the glued joints will not be affected by exposure to sub zero temperatures during the curing process.

- FIREPRO® glue may be used to attach cover boards onto cured noggins (and in glued board joints), provided that a 24 hour interval is acceptable before further trades work on such protected steelwork.
ROCKWOOL BEAMCLAD® Systems

Fire protection solutions for structural steel & soffit protection

As part of the comprehensive FIREPRO® range of fire protection products, ROCKWOOL BEAMCLAD® systems boast a complete ‘tool-box’ of options, offering contractors simple and economical fire protection solutions to the very real diversity of modern steel constructions.

Proven in service over many years, these versatile dry fix systems have been widely used to combat the extremes of site, mixed trade and climatic conditions.

ROCKWOOL BEAMCLAD® has been assessed and third party approved for use with solid structural steel sections and cellular sections.

Configuration options

ROCKWOOL BEAMCLAD® boards can be fitted to provide dry joint solutions offering up to 2 hours fire protection, or glued solutions where extended protection up to 4 hours is required.

Figure 1: The unique ROCKWOOL BEAMCLAD® dry fix clip system (International Patent Application No PCT/GB 00/01955)

General benefits:
- No maintenance
- Moisture-repellent
- Choice of three finishes
- Easy to repair

Dry fix solutions
- Unique clip fix system
- Quick and simple to apply
- Up to 2 hours fire protection
- Dry process, no masked off areas required

Glue fix solutions
- Traditional noggin and stud welded pin systems
- Up to 4 hours fire protection
- High resilience

Composition & manufacture

ROCKWOOL BEAMCLAD® is manufactured primarily from a melt of volcanic rock and limestone. The molten rock is spun into a wool and immediately impregnated with special resins for handling and shaping. The material is then compressed, cured and formed into boards.

ROCKWOOL BEAMCLAD® boards are sized 2000 x 1200mm, in a range of thicknesses from 25mm up to 60mm.

Board density
- Nominally 167 – 180 kg/m³.

Standards

ROCKWOOL BEAMCLAD® fire protection materials have been assessed to BS 476: Part 21: 1987 for the fire protection of loadbearing steelwork for up to 4 hours protection.

ROCKWOOL BEAMCLAD® Systems are third party approved for use with solid structural loadbearing steelwork for up to 4 hours protection.

Performance & properties

Fire performance
Up to 4 hours fire resistance for structural steelwork, assessed at critical temperatures between 350°C and 700°C, including the default temperatures of 550°C (columns) and 620°C (beams). Un-faced, aluminium-foil and glass tissue faced product options comply with both non-combustible and Class O definitions in UK Building Regulations.

Moisture
The rockwool fibres of ROCKWOOL BEAMCLAD® boards are randomly oriented, avoiding any tendency to promote capillary action or hygroscopic moisture absorption.

Moisture content
- 0% in air-dried state.

Moisture absorption
- 0.004% by volume at 20°C and 90% relative humidity.

Water absorption
Maximum 60 g/m² after 24 hour total water immersion testing (i.e. approximately 1.5% by weight for 25mm plain board).

High air flow situations

Unfaced ROCKWOOL BEAMCLAD® systems have been evaluated for use in return air plenums, by the Institute of Occupational Medicine to World Health Organisation test standards and for use in subways, for train speeds up to 150 km per hour.

The product has been authorised for use in LUL surface and sub-surface premises when installed in accordance with this document and the Australian/New Zealand Standard AS 1045.1.1. Certification and product details are listed in the LUL Approved Product Register website www.LULapril.co.uk for specific details.
Construction & installation guidance

A comprehensive range of practical systems is available to meet a variety of site requirements.

**ROCKWOOL BEAMCLAD® dry joint systems**
These use either purpose-made clips, glued mineral wool noggins or stud welded pins to secure the insulation to structural steel sections. All board-to-board joints are straight butt joints, without the need for glue. Pigtail screws (minimum twice the insulation thickness, less 5mm) are used to secure the insulation boards to each other and/or to the noggins.

**ROCKWOOL BEAMCLAD® glued joint systems**
These use an inorganic and non-toxic glue to bind board-to-board joints and/or to the noggins. Standard flat head nails, twice the thickness of the insulation, are used as initial supports.

**Installation options**

**Dry board joint systems**

**Clip fix application**
A quick and user-friendly dry joint board system featuring ROCKWOOL’s push-fit clips. The spring action of the clip creates a vice-like grip on the steelwork flange. The ROCKWOOL BEAMCLAD® board is impaled on to the clip pins and held in place with spring steel non-return washers. Supplementary pigtail screws fixed through the side boards into the soffit boards complete this system.

The clips are located at max. 600mm centres to top flange and max. 900mm centres to bottom flange, with pigtail screws for board to board joints at 150mm centres. Combined clip and stud welded pin dry joint system

Where it is not possible to clip fix, eg beneath concrete soffits, stud welded pins (at the same fixing centres) are used in lieu of the clip fixing.

A/V limit for 2 hours = 200

**Glued noggins application**
A fast, easy to apply, dry joint board system where noggins are glued into position between the steelwork flanges using FIREPRO® Glue. Noggins are fixed at 1000mm nominal centres. The ROCKWOOL BEAMCLAD® boards are then retained by means of pigtail screws, fixed at 150mm nominal centres to the noggins and 200mm centres for board-to-board joints.

For beam depths over 533mm a Tee-noggin or full depth solid noggin is used to provide the support for the cover boards.

**Stud welded pin application**
A dry joint system employing steel welded pins.

The steelwork is cleaned in the area where the welded pin is to be positioned. The pin is then welded to the steel flange.

The ROCKWOOL BEAMCLAD® board is then impaled on to the stud welded pins and held in place with spring steel non-return washers.

The stud welded pins are fixed at max. 600mm centres to top flange and max. 900mm centres to bottom flange. The ROCKWOOL BEAMCLAD® board-to-board joints are then secured by means of pigtail screws fixed at nominal 150mm centres.

**Glued board systems**

Glue-fixed noggins and board-to-board glued joints, ROCKWOOL BEAMCLAD® noggins (at 1000mm nominal centres) are glued between the steelwork flanges, and the ROCKWOOL BEAMCLAD® side boards are glued to the noggins. The ROCKWOOL BEAMCLAD® side boards are also glued at all vertical joints and horizontal board-to-board joints.

Round head nails (length 2 x thickness of board) are fixed through the side boards into the noggins (min 2) and soffit boards (at 400mm nominal centres) to consolidate the glued joints.

**Stud welded pins and board-to-board glued joints**

Pins are stud welded at max. 600mm centres to top flange and max. 900mm centres to bottom flange. All board-to-board joints are glued and nailed.

**Board jointing**

**Butted corner joints**

Butted corner joints are made with square edge boards using either a dry joint with pigtail screws as below, or FIREPRO® Glue and nails at 400mm centres.

**Axial joints**

All axial joints are made with square butt edges, without nails. Glue is only required for glued board systems.

For Foil faced products, joints can be finished with Class ‘O’ foil tape.

**Noggins**

ROCKWOOL BEAMCLAD® boards can be fixed to noggins, cut from ROCKWOOL BEAMCLAD® offcuts of at least the same thickness as the facia and soffit boards.

The edges of the noggins are glued where they contact the steelwork, then, once the glue has set firmly, the cover boards are fixed in position with either pigtail screws or FIREPRO® Glue and nails.

**Welded steel pins**

Boards are impaled onto stud welded pins and secured with nonreturn washers.
Installation options

**Cellular**

The method for determining the thickness of ROCKWOOL BEAMCLAD® required to protect a cellular or castellated beam:

- Calculate the effective section factor using the following equation:
  \[
  \text{Section factor (m}^{-1}) = \frac{1400}{t}, \quad \text{where } t = \text{the thickness (mm)}
  \]
- Confirm the limiting design temperature of the beam with the manufacturer. In the absence of such information, a conservative fail temperature of 450°C can be used.

- Using the calculated section factor and protection period required, determine the thickness of ROCKWOOL BEAMCLAD® for a solid beam from the appropriate fire protection table for the limiting design temperature (or 450°C) and the fixing system being considered.
- Multiply this thickness by 1.20 to obtain the ROCKWOOL BEAMCLAD® thickness for the cellular or castellated beam.

**Installation options**

- Figure 11 - Beam with circular holes (boxed & profiled protection – glued and pinned joints)
- Figure 12 - Beam with square or rectangular holes (boxed & profiled protection – glued and pinned joints)
- Figure 13 - Beam with circular holes (boxed protection – dry joints)
- Figure 14 - Beam with square or rectangular holes (boxed protection – dry joints)

**Joints & glue**

FIREPRO® Glue is an inorganic, non-toxic product with a pH of 11. FIREPRO® Glue is supplied pre-mixed in 17 kg tubs. A variety of joint types can be used (see previous page).

Coverage rate will depend on the linear length of the joints, width of joint (board thickness) and joint depth. Assuming total, effective usage of the glue on site, the following table provides an approximate weight (kg) of glue per linear metre of joint, based on a glue depth of 1mm.

<table>
<thead>

</table>

In practice, a degree of wastage would be expected and as such, it would be prudent to make an allowance for this when placing an order. As a very approximate guide, the coverage rate of a 17kg tub of FIREPRO® glue would be 35m² of applied board.

**Supply**

ROCKWOOL BEAMCLAD® slabs are supplied on pallets, shrink-wrapped in polyethylene, 26 pallets per 40 ft container.

Pigtail screws are available from ROCKWOOL stockists.

ROCKWOOL BEAMCLAD® clips are available in 2 sizes from ROCKWOOL in boxes of 1800 – small for 25mm and 30mm, large for 25mm and 40mm.

Washers are available from ROCKWOOL in boxes of 2000.

Welded pins and sprung steel non-return washers are available from external suppliers.

Fire Tube is also available for circular steel sections.

Fire Duct dry fix ductwork solutions are also available for structural steel duct protection.

**Typical specification clauses**

(to be read in conjunction with System Options on previous page)

1. The structural steel is to be fire protected using ROCKWOOL BEAMCLAD® system, with a ... facing, to provide ... fire resistance.

2. The main fixing system will be one of:
   - ROCKWOOL BEAMCLAD® stud welded pin system fixed at max. 600mm centres to top flange, and max. 900mm centres to bottom flange,
   - ROCKWOOL BEAMCLAD® noggin system fixed at 1000mm centres,
   - ROCKWOOL BEAMCLAD® clip system fixed at max. 600mm centres to top flange, and max. 900mm centres to bottom flange.

3. Board-to-board joints should be dry fixed using pigtail screws or glued and nailed in accordance with the data sheet.

4. Insert system type
5. Insert facing option
6. Insert period of fire resistance
**ROCKWOOL BEAMCLAD® Systems**

**Contractors’ Fixing Guide**

As part of the comprehensive FIREPRO® range of fire protection products, a new generation of dry fixing options has been added to the existing glued joint, pin and noggin systems. All have been tested or assessed to BS 476: Part 21: 1987.

This document explains and illustrates the installation methods using the six fixing options:

- **Clip fix dry joint board system**
- **Stud welded pin dry joint board system**
- **Glued noggin dry joint board system**
- **Combined clip and stud welded pin dry joint system**
- **Stud welded pin glued jointed board system**
- **Glue fix noggin, glued jointed board system**

**Scope**

Contractors are required to install materials as tested and detailed in this brochure. In situations not covered by this brochure, ROCKWOOL will either recommend a suitable detail or assist in obtaining an independent Design Appraisal.

**Applications**

This Fixing Guide provides details of all of the standard boxed applications. It covers fixing centres and details of available facings and joint details. Dry board joints for up to 2 hours fire protection.

**ROCKWOOL BEAMCLAD® boards**

Dense ROCKWOOL boards are available with facings of glass tissue and reinforced aluminium foil as well as plain product. Size: 2000 x 1200mm. Thicknesses: 25, 30, 35, 40, 45, 50, 55 and 60mm.

**BEAMCLAD® clip system – Critical steel temperature 600°C, 4 sided protection for beams**

ROCKWOOL BEAMCLAD® clip system – Critical steel temperature 600°C, 5 sided protection for beams & columns

The unique ROCKWOOL BEAMCLAD® clip fixing system is designed for ultimate speed of application. Its design features allow it to be used with standard steel deck types. The ROCKWOOL BEAMCLAD® clip fixing solution can be used to provide 2, 3 and 4-sided beam protection for up to 2 hours*.  

* 2 hour A/V limitation: 200m⁻¹

**Installation sequence**

- Friction fit the correct length clips (see A/V chart) onto the top and bottom flange tips at max. 600mm centres for the top flange (A) & max. 900mm centres for the bottom flange. (D) The first clip is positioned at max. 100mm in from the beam edge (B).
- Cut the ROCKWOOL BEAMCLAD® boards to suit the depth of the beam whilst allowing for the additional flange cover board thickness.
- Using the deck soffit as a guide, impale the ROCKWOOL BEAMCLAD® boards onto the clip legs, always starting at the top.
- Fit special ROCKWOOL BEAMCLAD® non-return washers during installation.
- Apply pigtail screws horizontally at 200mm centres during installation.
- No masking of area required during installation.
- Clean, dry solution allowing other trades to work in same area during installation.

**Benefits**

- Simple to apply, dry push-fit
- Fast application rates
- No plant or equipment required
- Up to 2 hours fire protection
- Max. 2 hours A/V = 200
- Option of three finishes
- Easy system to repair, if damaged
- Simple to apply, dry joint board system
- Fast to install, dry fix stud welded pin system
- Only dry joint stud welded pin system
- Stud pin fixing centres at max. 400mm cts for top flange and max. 900mm for bottom flange
- Up to 2 hours fire protection
- Pigtail screws at max. 150mm centres in place of glued board joints

**ROCKWOOL BEAMCLAD® thicknesses to be read with Chart 1 & 2**

The following key provides the required minimum thicknesses of ROCKWOOL BEAMCLAD® for the Section Factors given in the table.

- A = 25mm - Use small clips
- B = 30mm - Use small clips
- C = 35mm - Use large clips
- D = 40mm - Use large clips
A traditional stud welded pin solution with dry joints.
This dry fix pin solution can be used for 2, 3 and 4-sided beam protection for a period of up to 2 hours.

**Installation sequence**
- Clean the local area for pin welding and fix stud pin using arc or CD welds, ensuring a good contact has been achieved. Test weld by bending pin.
- Impale the ROCKWOOL BEAMCLAD® boards onto the stud welded pins using the deck soffit as a guide.
- Push 38mm diameter sprung steel non-return washers onto the exposed pin until tight to the cover board face. Crop pins as necessary.
- Fix pigtail screws along all board-to-board edge joints at 150mm maximum centres (c). Tape joints using aluminium foil tape or scrim, if required.

**ROCKWOOL BEAMCLAD® thicknesses to be read with Charts 3 & 4**
The following key provides the required minimum thicknesses of ROCKWOOL BEAMCLAD® for the Section Factors given in the table.
- A = 25mm
- B = 35mm
- C = 30mm
- D = 40mm
- E = 45mm
- F = 50mm
- G = 55mm
- H = 60mm
Typical details

Fixing pattern

Figure 13

Figure 14

Figure 15 - 2-sided box

Figure 16 - 2-sided box

ROCKWOOL BEAMCLAD® glue noggin dry joint board system

A noggin solution which removes the necessity for glue to board-to-board and board-to-noggin joints. The board-to-board edge joints are fixed with pigtail screws at 200mm centres. The glued noggins are at 1000mm fixing centres. This fixing solution can be used for 2, 3 and 4-sided beam protection for up to 2 hours.

Installation sequence

- Cut 120mm wide noggins (C) to suit web depth, using same thickness material as the cover protection. For web depths of 500mm and above use either solid noggins or ‘T’ shaped noggins made from cover board thickness. These are then glued into position at 1000mm centres (D).
- Cut the ROCKWOOL BEAMCLAD® boards to suit the depth of the beam whilst allowing for the additional flange cover board thickness.
- Push board tight to deck soffit and fix pigtail screws through the coverboards and into the noggins at maximum 100mm centres (B).
- Fix all board-to-board joints using pigtail screws at 200mm maximum centres (A). Minimum screw length must be 2 x cover board thickness – 5mm.

ROCKWOOL BEAMCLAD® glue noggin dry joint board system

A noggin solution which removes the necessity for glue to board-to-board and board-to-noggin joints. The board-to-board edge joints are fixed with pigtail screws at 200mm centres. The glued noggins are at 1000mm fixing centres. This fixing solution can be used for 2, 3 and 4-sided beam protection for up to 2 hours.

Installation sequence

- Cut 120mm wide noggins (C) to suit web depth, using same thickness material as the cover protection. For web depths of 500mm and above use either solid noggins or ‘T’ shaped noggins made from cover board thickness. These are then glued into position at 1000mm centres (D).
- Cut the ROCKWOOL BEAMCLAD® boards to suit the depth of the beam whilst allowing for the additional flange cover board thickness.
- Push board tight to deck soffit and fix pigtail screws through the coverboards and into the noggins at maximum 100mm centres (B).
- Fix all board-to-board joints using pigtail screws at 200mm maximum centres (A). Minimum screw length must be 2 x cover board thickness – 5mm.

The following two systems are well established having been used for many years. The application of FIREPRO® Glue enhances the fire performance over the Dry Joint Systems for the 2, 3 and 4 hour periods. The Glue Joint Systems are capable of providing up to 4 hours fire protection.

Fixing boards to noggins
Wherever three or four-sided protection is required, fixing to noggins is a practical option. No power supply is required.

Fixing boards with stud welded pins
Situations will always occur where noggins do not afford a practical choice, e.g. for two-sided box constructions or diverse perimeter bracketing.

Stud welded pins allow the installer a simple, tested alternative to noggins.

Installation sequence (noggin fix)
Fixing noggins
Cut 120mm wide noggins to suit web depth, using same thickness material as the cover protection. For web depths of 500mm and above use either solid noggins or 't' shaped noggins. For stability purposes, it is recommended that the face of the 't' noggin is made from the same thickness as the cover board but the thickness of the return into the web should be at least 50mm. These are then glued into position at 1000mm centres.

Fixing boards
Apply FIREPRO® Glue liberally to face of noggins. Quickly apply vertical boards and secure with nails long enough to pierce full thickness of noggins before FIREPRO® glue forms a hardened surface.

If using faced boards, apply foil or scrim tape over joints for uniformity of appearance.

For additional fixing details not covered, please contact ROCKWOOL Technical Solutions. For A/V charts, see Charts 3 and 4 (Stud Welded).
Typical details

Figure 23 - 3-sided box
A noggins to project slightly beyond flange

Figure 24 - Full depth noggins or Tee-noggins
for web depths greater than 500mm

Fixing pattern

Figure 25 - Fixing method using glued noggins, nails and glued board-to-board joints
Dimensions
A = noggins at max. 1000mm centres
B = nails at max. 150mm centres
C = nails at max. 400mm centres (max. 30mm from edge of board joint)

Figure 26 - 3-sided box with stud welded pins
Dimensions
A = stud welded pins at 600mm for 2800mm board (500mm for 1200mm boards)
B = stud welded pins at max. 100mm (min. 20mm) from edge of board
C = nails at max. 400mm centres
D = stud welded pins at max. 900mm centres for 2000mm boards, 500mm centres for 1200mm boards, on bottom flange

Figure 27 - 2-sided box
W. Limit is 100mm. For W>100mm, a shelf angle or similar should be fixed to the wall

* For flange widths greater than 200mm, 2 rows of pins are required, each row approx. 25mm from flange tips.

Figure 28 - 2-sided box
W. Limit is 100mm. For W>100mm, a shelf angle or similar should be fixed to the wall

ROCKWOOL BEAMCLAD® glued systems

Selecting the thickness of ROCKWOOL BEAMCLAD® board for glued systems
Charts 7, 8 and 9
The following key provides the required minimum thicknesses of ROCKWOOL BEAMCLAD® for the Section Factors given in the tables. The boards can be applied in either one or two layers.

</tr>
</tbody>
</table>

Multi-layer applications
When a protection thickness in excess of 60mm is required, this can be achieved by plying two or more layers of ROCKWOOL BEAMCLAD® together. Where practical, stagger the joints between each layer.

For welded pin applications, each layer should be retained using separate non-return washer, i.e. one washer per layer.

For glued noggins applications, attach the first layer to the noggins as previously detailed, then apply a 120mm wide band of glue to the outside face of the first layer at locations corresponding to the noggins.

Apply the outer layer of ROCKWOOL BEAMCLAD®, supporting the boards until the glue sets by using nails of sufficient length to penetrate completely through the noggins.

ROCKWOOL BEAMCLAD® thicknesses to be read with Charts 7, 8 and 9
General notes

Butted corner joints
Butted corner joints are made with square edge boards and depending on the system employed, use either a dry joint with pigtail screws at 150mm or 200mm centres, or FIREPRO® Glue and nails at 400mm centres.

Axial joints
All axial joints are made with square butt edges, without nails. Glue is only required for glued board systems. Joints must be tightly butted.

Glow
FIREPRO® Glue is required between all board-to-board and board-to-noggin joints for glazed systems, but only between noggin-to-steel joints for dry systems.

Applying FIREPRO® Glue on the external face of joints is bad practice.

Whatever noggin system is employed, the glue between noggin and steel must be allowed to set hard before cover boards are applied to the noggins. This will normally take about 4 hours at 20°C ambient temperature.

FIREPRO® Glue is supplied pre-mixed in 17 kg tubs.

Coverage rate will depend on the linear length of the joints, width of joint (board thickness) and joint depth. Assuming total, effective useage of the glue on site, the following table provides an approximate weight (kg) of glue per linear metre of joint, based on a glue depth of 1mm.

### Table 1

<table>
<thead>
<tr>
<th>Thickness (mm)</th>
<th>Square butt joint</th>
<th>45° mitre joint</th>
</tr>
</thead>
<tbody>
<tr>
<td>25</td>
<td>0.09</td>

<td>0.19</td>
<td>0.27</td>
</tr>
<tr>
<td>60</td>
<td>0.22</td>
<td>0.33</td>
</tr>
</tbody>
</table>

In practice, a degree of wastage would be expected and as such, it would be prudent to make an allowance for this when placing an order. As a very approximate guide, the coverage rate of a 17kg tub of FIREPRO® glue would be 35m² of applied joint.

Noggings
ROCKWOOL BEAMCLAD® boards can be fixed to noggings, cut from ROCKWOOL BEAMCLAD® outskirts.

The edges of the noggings are glued where they contact the steelwork. Once the noggings have set firmly, the cover boards are fixed in position with either pigtail screws or FIREPRO® Glue and nails. The thickness of the noggin is to be the same as that of the cover board used.

Welded steel pins
Boards are secured to stud welded pins with non-return washers.

Section Factor A/V

<table>
<thead>
<tr>
<th>3 sides</th>
<th>4 sides</th>
</tr>
</thead>
<tbody>
<tr>
<td>9392</td>
<td></td>
</tr>
</tbody>
</table>
Determining protection thickness

- The table opposite indicates the effect on A/V for three and four sided schemes
- Determine A/V factor from the table or by calculating for other exposure situations, ensuring the correct mass per metre is used
- Establish the period of fire protection required
- For A/V factors in excess of 260, contact ROCKWOOL for advice on both thicknesses and fixing methods preferred
- Bracing members: These do not generally require protection. If required as an essential element to the fire resistance, use A/V not greater than 200 m⁻¹
- Where steel beams are fixed to composite steel and concrete decks, the profiled re-entrant void may not need additional protection if allowances for board thickness or steelwork section factor are made

See the ASFP Yellow Book 1.7 for current independent guidance.

General notes for systems

- Ensure steel is free from grease, dust or loose particles where noggins are to be glued, pins welded or clips applied
- Dry off steelwork where large water droplets are present. Steel damp to the touch is acceptable.
- Ensure that all noggins have the correct friction fit. Avoid excessive interference that may cause noggins to bend.
- Fix additional noggins (if required) at beam ends, beam-to-beam joints and large penetrations. For stud welded pin and clip systems it may be necessary to introduce soldier noggins into webs behind board to board joints to increase stability of the system on steelwork with large web depths.
- For glued system options ensure that all noggin-to-beam, noggin-to-board and board-to-board surfaces are glued, and that the required setting time is allowed
- Remove any excess glue for neatness
- Any localised board shaping to be made at the point of installation should be carried out with a sharp knife or fine-toothed saw
- Avoid ‘nuisance dust’ from cutting operations lying on boards prior to installation
- Always use sharp-edged cutting tools
- The length of all nails used should be at least twice the thickness of the board being fixed
- Pigtail screw length should be twice the thickness of the board being fixed, less 5mm
- All board to board joints must be tightly butted

Vapour barriers

Glass-reinforced aluminium foil-faced ROCKWOOL BEAMCLAD® A/F provides an excellent vapour seal. For integrity of the foil, all edges should be taped (with a minimum 75mm wide) plain foil tape. Idenden T 303 tape is recommended as being suitable. Taped joints also prevent damage to foil edges during construction.

Board joints (glued)

No glue is required where boards meet wall or soffit surfaces, except in cases where a temporary fix to flange faces may be advantageous to the work sequence. Close contact between boards at joints is always essential.

Painted steel

Painting of structural steelwork is not always essential for corrosion protection. BS 8202: Part 1: 1995 permits the use of unpainted steel which is both interior to the building and in an area which will be constantly heated.

ROCKWOOL BEAMCLAD® thickness

In selecting ROCKWOOL BEAMCLAD® thicknesses, due consideration must be given to the required period of fire resistance and the A/V value of the steel sections concerned.

Supply

ROCKWOOL BEAMCLAD® slabs are supplied on pallets, shrink-wrapped in polyethylene. Pigtail screws are available from ROCKWOOL stockists. Clip fix ROCKWOOL BEAMCLAD® clips are available from ROCKWOOL in boxes of 1000. ROCKWOOL BEAMCLAD® washers are available from ROCKWOOL in boxes of 2000. Welded pins and sprung steel non-return washers are available from external suppliers.

References

ROCKWOOL BEAMCLAD® systems are part of the ROCKWOOL FIREPRO® range of fire protection products ranging from cavity fire stops to blastwall solutions for oil rigs.

Notes
